            Medical Center Dr, Rockville, MD 20850, USA
  REMARK    The H. influenzae sequence has been updated by R. Fleischmann. New
            database matches have been assigned, product names have been
            improved, and a number of frame shifts have been corrected. We
            gratefully acknowledge the work of Tatusov et. al. We have
            incorporated their annotation into the /notes fields of the
            corresponding H. influenzae genes

```

NOTICE: This sequence may not be the entire insert of this clone. It may be shorter because we only sequence overlapping sections once, or longer because we provide a small overlap between neighboring submissions.

This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone

NEIGHBORING COSMID INFORMATION:

The 5' cosmid is F29A7, 200 bp overlap;3' end lies in a gap. Actual start of this cosmid is at base position 197 of CELF08D12; actual end is at 33268 of CELF08D12. This cosmid lies in an unanchored cluster, the orientation of which is unknown.

NOTES:

Coding sequences below are predicted from computer analysis, using the program Genefinder(P. Green and L. Hillier, ms in preparation).

TITLE Direct Submission
JOURNAL Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre, Hinxton, Cambridge CB10 1RQ, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA. E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT Coding sequences below are predicted from computer analysis, using

predictions from Genefinder (P. Green, U. Washington), and other available information.
For a graphical representation of this sequence and its analysis see:-
http://webace.sanger.ac.uk/cgi-bin/display?db=wormace&class=Sequence &object=R07H5
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
IMPORTANT: This sequence is not the entire insert of clone R07H5. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
The true left end of clone R07H5 is at 1 in this sequence. The true right end of clone R07H5 is at 6112 in sequence Z68335.
The true left end of clone C29F4 is at 33698 in this sequence. The true right end of clone C08F8 is at 9591 in this sequence. The start of this sequence (1. .107) overlaps with the end of sequence Z73103.
The end of this sequence (33698. .33802) overlaps with the start of sequence Z68335.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-4, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is RG114A06, 200 base overlap. The
            actual start of this clone is at base position 124318 of RG114A06;
            actual end is at 37000 of DJ0866N18.

            This clone contains STS sWSS377 (NID:g388836).

  TITLE     2.2 Mb of contiguous nucleotide sequence from chromosome III of C.
            elegans
  JOURNAL   Nature 368 (6466), 32-38 (1994)
  MEDLINE   94150718
REFERENCE   2  (bases 1 to 42361)
  AUTHORS   Ainscough,R.
  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre,
            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=C25D7
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            This sequence is the entire insert of clone C25D7. The true left
            end of clone C01G10 is at 35450 in this sequence. The true right
            end of clone F14H8 is at 19646 in this sequence. The start of this
            sequence (1. .104) overlaps with the end of sequence Z81061.
            The end of this sequence (35450. .42361) overlaps with the start of
            sequence Z81030.

LOCUS       HS422H11   112984 bp    DNA              PRI       16-MAY-1998
DEFINITION  Homo sapiens DNA sequence from PAC 422H11 on chromosome
            6p21.1-22.2. Contains the gene coding for two isoforms of a known
            Serine Kinase. Contains ESTs, STSs and a GSS, complete sequence.
ACCESSION   Z99128
NID         g3135974
KEYWORDS    HTG; Serine Kinase.
SOURCE      human.
  ORGANISM  Homo sapiens
            Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria;
            Primates; Catarrhini; Hominidae; Homo.

  TITLE     Direct Submission
  JOURNAL   Submitted (08-MAY-1998) sanger.ac.uk/HGP/Chr6/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On May 18, 1998 this sequence version replaced gi:2578108.
            IMPORTANT: This sequence is the entire insert of clone 422H11.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
```

```
            human chromosome 6, constructed in collaboration by the Sanger
            Centre chromosome 6 mapping group and Ioannis Ragoussis. Further
            information can be found at http://www.sanger.ac.uk/HGP/Chr6/ This
            sequence has been finished according to sequence map criteria as
            follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 422H11 is at 1 in this sequence. The
            true right end of clone 422H11 is at 112984.
            422H11 is from the library RPCI3 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished sequence: dJ516C23 Contig_ID: 00970 acc=Z93021
            Length: 118021 bp.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            This clone was originally isolated in the laboratory of Professor
            Graeme Bell, Howard Hughes Medical Institute and Departments of
            Biochemistry and Molecular Biology, and Medicine, The University of
            Chicago, Chicago, IL, USA.  The clone was provided by the
            laboratory of Dr. Roger Cox at The Wellcome Trust Centre For Human
            Genetics, Oxford, UK.  Some contig information was also obtained
            from Yamagata et al., Nature 384:455-8 (1996).

            SOURCE INFORMATION:
            This clone is from the first release of the human BAC library.  The
            library contains cloned DNA from a human male fibroblast cell line
            978SK.  See:  Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7
            (1992); Kim et al., Genomics 34:213-8 (1996).  The clone is
            available from Research Genetics, Inc. (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the right is H_127H14, 200 bp overlap.
            Actual start of this clone is at base position 1 of H_7E17; actual
            end is at 73841 of H_127H14.

            This clone contains STS WI-5762 (NID:g721907).

            Order of segments is not known; 800 n's separate segments.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.
            ***                                                        ***
            *** WARNING: Phase 1 High Throughput Genome Sequence ***
            ***                                                        ***
```

```
            * This sequence is unfinished. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.

LOCUS       H41523        390 bp    mRNA            EST       31-JUL-1995
DEFINITION  yn90g09.r1 Homo sapiens cDNA clone 175744 5'.
ACCESSION   H41523
NID         g917575
KEYWORDS    EST.
SOURCE      Homo sapiens clone=175744 library=Soares adult brain N2b5HB55Y
            vector=pT7T3D (Pharmacia) with a modified polylinker host=DH10B
            (ampicillin resistant) primer=M13RP1 Rsitel=Not I Rsite2=Eco RI
            55-year old male. 1st strand cDNA was primed with a Not I -
            oligo(dT) primer [5'
            TGTTACCAATCTGAAGTGGGAGCGGCCGCGCTTTTTTTTTTTTTTTTTT 3'],
            double-stranded cDNA was size selected, ligated to Eco RI adapters
            (Pharmacia), digested with Not I and cloned into the Not I and Eco
            RI sites of a modified pT7T3 vector (Pharmacia). Library went
            through one round of normalization to a Cot = 53. Library
            constructed by Bento Soares and M.Fatima Bonaldo. The adult brain
            RNA was provided by Dr. Donald H. Gilden. Tissue was acquired 17-18
            hours after death which occurred in consequence of a ruptured
            aortic aneurysm. RNA was prepared from a pool of tissues
            representing the following areas of the brain: frontal, parietal,
            temporal and occipital cortex from the left and right hemispheres,
            subcortical white matter, basal ganglia, thalamus, cerebellum,
            midbrain, pons and medulla.
  ORGANISM  Homo sapiens

                        polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-A1
                        library is a subtracted library derived from the UI-R-A0
                        library. The UI-R-A0 library  consisted of a mixture of
                        individually tagged normalized libraries constructed from
                        rat placenta, adult lung, brain, liver, kidney, heart,
                        spleen, ovary, and muscle. The tag is a string of 3-5
                        nucleotides present between the Not I site and the
                        oligo-dT track which allows identification of the library
                        of origin of a clone within the mixture. The subtracted
                        library (UI-R-A1) was constructed as follows: PCR
                        amplified cDNA inserts from a pool of approximately 3,840
                        UI-R-A0 clones from which 3' ESTs had been derived was
                        used as a driver in a hybridization with the UI-R-A0
                        library in the form of single-stranded circles. The
                        remaining single-stranded circles (subtracted library) was
                        purified by hydroxyapatite column chromatography,
                        converted to double-stranded circles and electroporated
                        into DH10B bacteria (Life Technologies) to generate the
                        UI-R-A1 library. This procedure has been previously
                        described (Bonaldo, Lennon and Soares, Genome Research 6:
                        791-806, 1996)"

DEFINITION  ym26b04.s1 Homo sapiens cDNA clone 49255 3'.
ACCESSION   H16570
NID         g882795
KEYWORDS    EST.
SOURCE      human clone=49255 library=Soares infant brain 1NIB vector=Lafmid BA
            host=DH10B (ampicillin resistant) primer=Promega -21m13 Rsite1=Not
            I Rsite2=Hind III Whole brain from a 73 days post natal female. 1st
            strand cDNA was primed with a Not I - oligo(dT) primer (5'
            AACTGGAAGAATTCGCGGCCGCAGGAATTTTTTTTTTTTTTTTT 3'); double-stranded
            cDNA was ligated to Hind III adaptors (Pharmacia), digested with
            Not I and directionally cloned into the Not I and Hind III sites of
            the Lafmid BA vector. Library went through one round of
            normalization. Library constructed by Bento Soares and M.Fatima
            Bonaldo.
  ORGANISM  Homo sapiens
            Eukaryotae; Metazoa; Eumetazoa; Bilateria; Coelomata;
            Deuterostomia; Chordata; Vertebrata; Gnathostomata; Osteichthyes;
            Sarcopterygii; Choanata; Tetrapoda; Amniota; Mammalia; Theria;
            Eutheria; Archonta; Primates; Catarrhini; Hominidae; Homo.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 454; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   circumsporozoite protein for malaria vaccines
PS   Disclosure; Fig 4; 20pp; English.
CC   The sequence given represents the RsaI restriction fragment from the
CC   genomic clone of Dd ras.  This sequence was inserted into the SmaI
CC   site of pGEM1 and sequenced.  Parts of this promoter sequence were
CC   placed in the vector pAV-CAT to generate a plasmid which resembled
CC   pEDII-CS (see also Q31692), with CS and leader peptides replaced by
CC   the chloramphenicol acetyl transferase gene (CAT). Discoidin I promoter
CC   by Dd ras promoter and the geneticin (G418) resistance gene under the
CC   control of the actin 15 promoter.  The terminator region was placed in
CC   the opposite orientation.

PT   Enriched oligonucleotides and corresp. sequences - used as
PT   markers for human genes transcribed in-vivo, facilitate tagging
PT   of most human genes
PS   Example 4; Page 447; 500pp; English.
CC   The Expressed Sequence Tag was isolated from a human brain cDNA
CC   library as part of a large set of ESTs which can be used as markers
CC   for human genes transcribed in vivo. They can be used to facilitate
CC   tagging of most human genes, for mapping locations of expressed genes
CC   on chromosomes, for individual or forensic identification, for mapping
CC   locations of disease-associated genes, for identification of tissue
CC   type, and for prepn. of antisense sequences, probes and constructs.
CC   EST01204 has an "poor" coding probability as evaluated using the
CC   coding-region prediction program CRM. See also Q59041-Q61440.

PT   New recombinant fucosyltransferase proteins - useful for modifying
PT   cell surface oligosaccharide structures
PS   Example 6; Page 291-292; 329pp; English.
CC   A DNA clone (T61680) codes for an enzyme (W13643) that functions as
CC   a GDP-Fuc:beta-D-Gal(1,4)-D-GlcNAc alpha(1,3)-fucosyltransferase
CC   (Fuc-TVI) which can utilise neutral type II oligosaccharide
CC   precursors but not type I glycoconjugates.  It was identified in a
CC   human lambda phage genomic DNA library using a probe obtd. from
CC   Lewis enzyme cDNA (see also T61675).  The Fuc-TVI DNA can be used
CC   to construct animal cell lines with specific capabilities with
CC   respect to post-translational modification of the oligosaccharides
CC   of expressed proteins or lipids, to produce recombinant Fuc-TVI for
CC   use in oligosaccharide prodn., to genotype individuals at this
CC   fucosyltransferase locus, and in the prodn. of chimeric
CC   fucosyltransferases (see also W14512-32).

PT   DNA construct for transforming plant cells - contains malic
PT   enzyme promoter used for inducible exogenous gene expression
PS   Claim 3; Figure 2; 23pp; English.
CC   A library was constructed from bean genomic DNA  and screened with a
CC   pME1 cDNA fragment of 1.4kb. One positive clone was isolated and
CC   characterised - gPvME1. The promoter sequence of the malic enzyme
CC   gene is given in Q53501. gPvME1 1-4.1HH, a plasmid subclone of
CC   gPVME1 comprising the promoter and part of the coding region, was
CC   used to isolate a 2821 bp HindIII-BclII fragment contg. approx. 2.65
CC   kb of the PvME1 promoter and leader sequences down to the BclI site
CC   immediately upstream of the ATG start codon. This fragment was
CC   inserted into the binary plant transformation vector pBI 101.4
CC   between the HindIII and the BamHI site of the polylinker, which has
CC   an overhang compatibility with BclI cut DNA. This construct was
CC   named pPvME1 Prom-GUS1. The promoter sequence of a malic enzyme
CC   gene contained within the insert in clone gPvME1 1-4.1HH which
CC   has been deposited in Aberdeen, Scotland (NCIMB 40498) has been
CC   claimed.

PT   Polynucleotide sequence from Acetobacter cdg operon - encodes
PT   cyclic di:guanosine mono:phosphate degradation enzymes e.g.
PT   3-phosphodiesterase isozyme
PS   Claim 3; Page 67-70; 98pp; English.
CC   A gene bank of Acetobacter 1306-11 was constructed in the broad host
CC   range, mobilisable cosmid pKT230C085. The average insert size was ca.
CC   30kb. The bank was screened with a 53bp PCR amplified probe whose
CC   sequence was expected to be an exact match for a diguanylate
CC   cyclase encoding gene. Three unique cosmid classes were identified
CC   corresponding to three different cdg operons. The cdg2 operon
CC   comprises at least 2 genes. Manipulating the expression levels of
CC   the different cdg2 genes is contemplated, particularly in cellulose
CC   producing bacteria.

PT   New family of multiple function regulatory proteins - regulate cell
PT   cycle progression, gastrulation, carcinogenesis, tumorigenicity,
PT   gonad development, etc.
PS   Claim 3; Fig 14a; 98pp; English.
CC   This cDNA sequence codes for human SPT5 (W19784), a novel multiple
CC   function regulatory protein (MFRP) that shows homology to yeast
CC   SPT5.  It was isolated from a human lung cDNA library using a human
CC   expressed sequence tag that showed homology to yeast SPT5.  The
CC   human SPT5 gene maps close to the ryanodine receptor at 19q13.
CC   SPT5 polynucleotides can be used to produce SPT5 polypeptides in
CC   host cells, or introduced in vitro, ex vivo or in vivo into a cell
CC   to regulate a cellular function associated with MFRP activity, such
CC   as cell cycle progression, control of gastrulation, carcinogenesis
CC   (such as breast cancer), tumorigenicity, inhibition or reversal of
CC   a neoplastic phenotype, progression through the cell cycle, gonad
CC   development, cardiogenesis or organogenesis.  They can also be used
```

```
CC   to restore wild-type MFRP function, such as tumour suppression, and
CC   as probes.

PT   Inhibition of export of leaderless protein from cells - using
PT   cardiac glycoside or its aglycone, e.g. ouabain or digoxin
PS   Claim 8; Pages 24-26; 61pp; English.
CC   This is the cDNA sequence of the leaderless protein FGF-1. The export of
CC   such leaderless proteins from a cell can be inhibited by a method which
CC   comprises contacting the cell with a cardiac glycoside or with an
CC   aglycone derivative of a cardiac glycoside. Preferably the glycoside is
CC   digoxin, strophanthin K, digitoxin, lanatoside A, ouabain, digitoxin,
CC   oleandrin or acovenoside A, and the aglycone is strophanthidin,
CC   digoxigenin, digitoxigenin or usarigenin. The method is useful for
CC   inhibiting export of leaderless proteins like FGF-1, FGF-2, IL-1 alpha,
CC   IL-1 beta , PD-ECGF, CNTF, thymosin, parathymosin, factor XIIIa, vas
CC   deferens protein, sciatic nerve growth promoting protein, L-14 lectin,
CC   transglutaminase, thioredoxin-like protein, HIV tat and int-2. Inhibition
CC   of export of FGF is useful for treating FGF-mediated pathophysiological
CC   conditions (e.g. melanoma, ovarian carcinoma, teratocarcinoma and
CC   neuroblastoma). It is useful for inhibiting proliferation of cells
CC   bearing an FGF-receptor, and for treating complications of diabetes.

PT   Polypeptide, DNA for human basic fibroblast growth factor -
PT   comprises speific aminoacid sequence, giving cell progogotion
PT   accelerating activity, low toxicity
PS   Disclosure; Fig 1-1 to 1-5, pages 562-6; 30pp; Japanese.
CC   The human basic fibroblast growth factor has cell propagation
CC   accelerating activity and low toxicity.  The growth factor is used as a
CC   medicine for burns, wounds, thrombosis or arteriosclerosis.  A large amt.
CC   of the growth factor is produced using recombinant DNA which contains
CC   the base sequence coding for the growth factor.  The growth factor is
CC   used in the form of powder, injections, tablets, capsules, liq. or
CC   ointment.

PT   Human basic fibroblast growth factor - produced by recombinant
PT   DNA techniques, useful for healing wounds, prophylaxis,
PT   thrombosis and arteriosclerosis treatment, etc.
PS   Disclosure; Fig 1; 38pp; English.
CC   hbFGF is produced using cDNA prepd. from RNA isolated from W138 or
CC   IMR90 human fibroblasts. hbFGF promotes growth of fibroblasts and
CC   other mesoderm-derived cells and is useful for promoting healing of
CC   wounds (e.g. burns), for prophylaxis and treatment of thrombosis and
CC   arteriosclerosis, and as a promoter for cell culture.

PT   New recombinant gene encoding basic fibroblast growth factor - in
PT   new high mol. wt. form, useful e.g. for stimulating tissue
PT   regenerating or treating infarction
PS   Disclosure; fig 3; 43pp; French.
CC   This recombinant gene encodes a basic fibroblast growth factor (bFGF)
CC   which stimulates growth of mesodermal and neuroectodermal cells.
CC   It is thus potentially useful e.g. for regenerating damaged tissues,
CC   and for treating myocardial infarctions, Parkinsons disease and
CC   Alzheimers disease.  It can be produced on a large scale using rec-
CC   ombinant DNA methods without risk of contamination.  There are a
CC   further 3 potential initiation codons allowing expression of larger
CC   forms of the protein.  See also Q05884.

PT   Synthetic ribozyme(s) for human papilloma virus (HPV) - useful in
PT   treatment of cervical cancer and in detection of HPV
PS   Disclosure; Page 25-29; 60pp; English.
CC   Synthetic ribozymes directed against human papilloma virus (HPV) 16
CC   may be used to cleave HPV or to detect HPV in human tissue.  The
```

```
CC   ribozymes cleave HPV to lower the production of the E6 and E7
CC   proteins which play a key role in keratinocyte transformation.  They
CC   can be used for the treatment of HPV infections which are associated
CC   with genital warts and genital neoplasms.  In particular they can be
CC   used for the treatment of cervical cancer optionally with other
CC   agents such as cisplatin.  Ribozymes are described in T40306-T40315.

PT   Evaluating risk of cervical dysplasia or cervical cancer - by
PT   detecting variant form of human papilloma virus 16
PS   Claim 1; Column 15-24; 33pp; English.
CC   Methods have been developed for distinguishing a subset of human
CC   papilloma virus (HPV) that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The methods involve:
CC   (1) preparing a cervical sample to expose any HPV-16 E6 gene in the
CC   sample and determining if the base at position 350 of the E6 gene
CC   (see T94723 and T94724 for comparison) is T or G, where the presence of
CC   G at position 350 is associated with an increased risk of developing
CC   cervical dysplasia or cervical cancer; and (2) preparing a cervical
CC   sample to expose any HPV-16 E6 protein in the sample and determining
CC   if the amino acid at position 83 of the protein (see position 90 in
CC   W35741 and w35742 for comparison) is Val or Leu, where the presence of
CC   Val at position 83 that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The present sequence
CC   represents the variant nucleotide sequence for HPV-16 E6. The 350G
CC   variant correlates well with Pap scores: 350T:350G ratios among 45
CC   HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for
CC   CIN II; 2:9 for CIN III; 0:3 for cancer.

PT   Evaluating risk of cervical dysplasia or cervical cancer - by
PT   detecting variant form of human papilloma virus 16
PS   Claim 1; Column 9-16; 33pp; English.
CC   Methods have been developed for distinguishing a subset of human
CC   papilloma virus (HPV) that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The methods involve:
CC   (1) preparing a cervical sample to expose any HPV-16 E6 gene in the
CC   sample and determining if the base at position 350 of the E6 gene
CC   (see T94723 and T94724 for comparison) is T or G, where the presence of
CC   G at position 350 is associated with an increased risk of developing
CC   cervical dysplasia or cervical cancer; and (2) preparing a cervical
CC   sample to expose any HPV-16 E6 protein in the sample and determining
CC   if the amino acid at position 83 of the protein (see position 90 in
CC   W35741 and w35742 for comparison) is Val or Leu, where the presence of
CC   Val at position 83 that is associated with an increased risk of
CC   developing cervical dysplasia or cervical cancer. The present sequence
CC   represents the reference nucleotide sequence for HPV-16 E6. The 350G
CC   variant correlates well with Pap scores: 350T:350G ratios among 45
CC   HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for
CC   CIN II; 2:9 for CIN III; 0:3 for cancer.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1191; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Detection and identification of organisms - using DNA primers to
PT   amplify signature segment of organism's type II topoisomerase
PS   Claim 6; Column 99-102; 114pp; English.
CC   A method has been produced for selectively amplifying DNA segments of
CC   one or more species of organisms in a sample. The method involves: (a)
CC   providing a database containing reference sequences, comprising a
CC   subunit sequence of a signature region of a macromolecule selected from
CC   a type II topoisomerase (TopoII), or a homologue, where each reference
CC   sequence is specific to a different species of a chosen group, and the
CC   macromolecule comprises 1st and 2nd conserved regions adjacently
CC   flanking the signature region; and (b) making an extract of DNA
CC   molecules, and selectively amplifying DNA segments of the signature
CC   region using a universal primer composition, comprising a primer
CC   constructed to bind a DNA encoding the macromolecule, to produce
CC   amplified DNA segments. The present sequence represents a DNA fragment
CC   containing a signature segment which is used in the database as a
CC   reference sequence for Shigella dysenteriae. The method can be
CC   used to identify all of the different organisms present in a single
CC   sample without using multiple probes. It can accurately distinguish
CC   among similar and related species, and can be used with, e.g.
CC   contaminated food products, tissue or fluid samples from diseased
CC   humans, animal or plants, soil samples and water samples from any
CC   source.

PT   Use of viral p35 polypeptide(s) for inhibiting chemokines - used
PT   for treating chemokine-mediated conditions such as inflammation and
PT   in binding assays
PS   Example 1; Page 26-27; 45pp; English.
CC   cDNA clones (T68963-65) respectively code for the p35 polypeptides
CC   (W17058-60) of cowpox virus, vaccinia virus Lister strain and
CC   variola (smallpox) virus.  p53 is a secreted protein that can be
CC   purified from the culture supernatant of cells infected with these
CC   viruses.  It binds to a number of chemotaxis-stimulating cytokines
CC   (chemokines) and can be used to treat chemokine-mediated conditions
CC   such as inflammation, or in binding assays.  Recombinant p35
CC   polypeptides can be produced in engineered host cells utilising
CC   expression vectors incorporating the isolated p35 DNA sequences.

PT   DNA fragment comprising human immunoglobulin Vh genes - for the
PT   production of human immunoglobulin in mammalian hosts
PS   Claim 48; Page 83-84; 130pp; Japanese.
CC   A series of genes (Q78939-79002) encoding human immunoglobulin variable
CC   heavy chains. The genes were isolated and cloned from a series of cosmid
CC   constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR
CC   amplification using primers Q78917-38.  The genes are subdivided into 5
CC   families of Vh genes.  The fragments cover a region of 800 kb.  The DNA
CC   fragments were isolated from high molecular weight DNA from human
CC   placenta.  The DNA was partially digested with TaqI restriction enzyme.
CC   The fragments were separated by gel elecrophoresis and 35-45 kb fractions
CC   were collected.  The fragments were ligated with ClaI-digested cosmid
CC   vector pJB81.  The ligation products were in vitro packed and infected
CC   into E.coli 490A.  The fragments were then subcloned by colony
CC   hybridisation.  The Vh genes and the DNA fragments encoding them are
CC   useful in producing human immunoglobulin in mammalian hosts.

PT   A primer for the detection and the determn. of a specific messenger
PT   RNA - can detect and determine specific mRNA(s) with high
PT   reliability
PS   Example 27; Page 29-30; 35pp; Japanese.
CC   Q74063 is the mouse beta-actin gene. This gene is amplified by the
CC   primers Q74045 and Q74046. The primers are used specifically for the
CC   detection and isolation of this sequence. They have the advantage of
CC   high sensitivity and reliability and are useful in the pharmaceutical
CC   industry.

PT   Recombinant feline herpes virus attenuated by alteration of the gE
PT   gene - and related homology vectors, useful in vaccines, also as
PT   vectors for delivering antigens or therapeutic agents to mammals and
PT   birds
PS   Example 1; Pages 76-78; 162pp; English.
CC   A novel feline herpesvirus (FHV) contains a deletion or insertion
CC   in the glycoprotein E (gp E) gene, i.e. the present sequence, in
CC   the unique short region of the viral genome. Altering the gp E
CC   gene, so that it no longer produces functional gp E, attenuates the
CC   virus. The attenuated virus is useful in vaccines to protect cats
CC   against FHV (and opt. against other diseases if appropriate DNA is
CC   inserted), and as a vector for delivering vaccinating antigens or
CC   therapeutic agents (e.g. antisense mols., riboxymes, interferon
CC   inducers, hormones, lymphokines, etc.) to other mammals (including
CC   humans) or birds.

PT   Expression vectors and methods for cloning N-terminal signal
PT   sequences - used for selection, expression and isolation of new
PT   signal sequences
PS   Claim 3; Page 28-30; 46pp; English.
CC   The sequence encodes human growth factor Wnt-10b, and has been
CC   isolated from a fetal bone marrow stroma cell cDNA library by PCR
CC   using consensus primers corresponding to conserved sequences within
CC   the Wnt gene family, followed by use of the amplified fragment as a
CC   probe and chromosome walking for isolation of the full-length
CC   sequence. A truncated sequence, Wnt-10b-delta, is given in T49319
CC   (claim 3). A plasmid containing the Wnt-10b cDNA has been deposited
CC   as ATCC 97208. Antibodies and antisense sequences corresponding to
```

```
CC   Wnt-10b may be used as pharmaceuticals, and Wnt-10b may be used in
CC   a culture medium for ex vivo haematopoietic stem cell culture for
CC   use e.g. in gene therapy. Fragments of the gene may be used as
CC   diagnostic probes or primers.

PT   Diagnosis and treatment of invasive tumours - especially breast
PT   cancer, using nucleotide probes and antibodies specific for
PT   stromelysin-3
PS   Example; Fig 2; 70pp; French.
CC   A cDNA bank was established from polyA-RNA of a fibroadenoma and
CC   screened with probes derived from polyA-RNA of metastatic tumours.
CC   Clones binding strongly were selected; one of these was found to be
CC   expressed at a high level only in malignant cancers of the breast,
CC   pharynx, head, neck and skin., which are characterised by
CC   deterioration of the extracellular matrix. This clone, which encodes
CC   stromolysin-3 (ST3), was sequenced (Q25698). A probe corresponding
```

```
CC   to human cDNA encoding ST3 was used to screen a mouse placenta cDNA
CC   library. This led to the isolation of cDNA with the sequence in
CC   Q35699. A comparison of the mouse and human ST3 sequences revealed
CC   89% homology in the amino acids of the mature protein; and
CC   approximately 55% homology in the pre- and pro-domains.

PT   Activin receptor-like kinase(s) with serine/threonine kinase
PT   domains - have activin/TGF beta-type I receptor function and can
PT   be used in diagnosis or therapy of rheumatoid arthritis,
PT   glomerular nephritis, fibrosis, etc.
PS   Claim 21; Page 53-55; 97pp; English.
CC   The inventors have identified a new family of receptor kinases
CC   called activin receptor-like kinases (ALK).  Their discovery was
CC   based on the realisation that receptor serine/threonine kinases
CC   form a new receptor family, which may include the type II receptors
CC   for other proteins in the transforming growth factor(TGF) beta
CC   superfamily. The activin receptor type II sequences from mouse and
CC   the daf1 gene product of C.elegans have high sequence similarity
CC   and were used to design degenerate primers to clone related cDNA's
CC   (see Q66643-49). Six distinct putative receptor serine/threonine
CC   kinases (ALK 1-6, of which human ALK 1-5 are Q66634-38 respectively,
CC   and the mouse ALK-1,3,4,and 6 are Q66639-42 respectively)
CC   were identified. Human ALK 4 cDNA was identified as having an ORF
```

```
CC   encoding  a truncated extracellular domain, the complete extracellular
CC   domain was obtained by RT-PCR using primers Q66648-49. Products of
CC   the invention can be used in therapy, eg. to modulate conditions
CC   associated with activin or TGF beta activity. These conditions include
CC   fibrosis, eg. liver cirrhosis and pulmonary fibrosis, cancer,
CC   rheumatoid arthritis and glomeronephritis.

PT   DNA encoding receptor tyrosine kinase, HER4 - related to human
PT   epidermal growth factor receptor, used for diagnosis and therapy of
PT   human cancers
PS   Disclosure; Page 129-132; 203pp; English.
CC   A DNA sequence (T18535) isolated from a human breast MDA-MB-453
CC   includes the 3' portion of a novel prototype receptor tyrosine
CC   kinase HER4 sequence (T18532); nucleotide 156 aligns with position
CC   2333 of the prototype.  The first 155 nucleotides differ from HER4
CC   and may represent the 5' untranslated region of a transcript derived
CC   from a cryptic promoter within an intfon of the HER4 gene.  The
CC   product (R91736) of the truncated sequence lacks the N-terminal
CC   767 amino acids of prototype HER4 (R91733).

PT   New recombinant nucleic acid expressing HER4 - a new receptor
PT   tyrosine kinase expressed in some cancer cells, and related
PT   vectors, antibodies, ligands etc, for diagnosis and treatment of
PT   cancers
PS   Claim 1; Fig 2B; 104pp; English.
CC   This sequence contains the 3'-portion of the HER4 sequence where
CC   nucleotide position 156 of the truncated sequence aligns with
CC   position 2335 of the complete HER4 sequence (Q64896) (just
CC   downstream from the region encoding the ATP-binding site of the HER4
CC   kinase).  The first 155 nucleotides of the truncated sequence are
CC   unique from HER4 and may represent the 5'-UTR of a transcript
CC   derived from a cryptic promoter within an intron of the HER4 gene.
CC   HER4 is the fourth member of the EGFR-family of tyrosine kinases and
CC   is expressed in some human cancers and in some tissues of neuronal
CC   or muscle origin.  HER4 polynucleotides, opt. labelled, are useful
CC   in assays (e.g. of HER4 mRNA to detect certain neoplasms, esp.
CC   breast carcinoma) and as primers in PCR or as probes.

PT   Disease resistance gene Hm1 from maize - is used to confer
PT   resistance to Cochliobolus carbonum.
PS   Claim 2; Page 20-22; 26pp; English.
CC   A DNA sequence is claimed having 90% translational homology to
CC   genomic or cDNA sequence of maize HM1 gene (Q99462 & Q99463). The
CC   gene HM1 controls resistance to Cochliobolus carbonum Nelson race 1.
CC   The HM1 gene can be used in conjunction with HC-toxin in a
CC   selectable marker system for use in maize transformation.
CC   This gene can also be inserted into the genomes of maize varieties
CC   which lack the gene to produce transformants that are resistance
CC   to disease caused by C. carbonum. The MH1 resistance gene is one of
CC   a family of homologous disease resistance genes in maize and other
CC   crops. The invention encompasses methods for identification of
CC   homologous disease resistance genes by using this gene or a
CC   fragment of it as a probe.

PT   Hm1 gene conferring race-resistance to Cochliobolus carbonum to
PT   maize - for use as a selectable marker for transformed maize
PT   cells
PS   Disclosure; Page 14-16; 19pp; English.
CC   Transposon mutagenesis was used to tag, clone and characterize the
CC   maize Hm1 gene.  Genomic and cDNA sequences of the Hm1 gene are
CC   provided in Q68433 and Q68434, respectively.

PT   New recombinant nucleic acid expressing HER4 - a new receptor
PT   tyrosine kinase expressed in some cancer cells, and related
PT   vectors, antibodies, ligands etc, for diagnosis and treatment of
PT   cancers
PS   Claim 4; Fig 1; 104pp; English.
CC   HER4 is the fourth member of the EGFR-family of tyrosine kinases and
CC   is expressed in some human cancers and in some tissues of neuronal
CC   or muscle origin.  HER4 polynucleotides, opt. labelled, are useful
CC   in assays (e.g. of HER4 mRNA to detect certain neoplasms, esp.
CC   breast carcinoma) and as primers in PCR or as probes.

PT   DNA encoding receptor tyrosine kinase, HER4 - related to human
PT   epidermal growth factor receptor, used for diagnosis and therapy of
PT   human cancers
PS   Claim 1; Page 111-116; 203pp; English.
CC   A DNA sequence (T18532) codes for a novel receptor tyrosine kinase,
CC   designated HER4/p180erbB4 or HER4 (R91733), which is related to
CC   epidermal growth factor receptor and which is expressed in several
CC   human cancers and in certain tissues of neuronal and muscular origin.
CC   It was obtd. by assembly of cDNA clones that had been obtd. from
CC   human breast MDA-MB-453 and human heart cell libraries by PCR
CC   amplification using primers (see T18536-42) based on conserved exons
CC   from kinase domains of HER2, HER3, EGFR and Xmrk.  Related sequences
CC   (see T18533 and T18535) were isolated from the MDA-MB-453 library.
CC   HER4 polynucleotides can be used in the prepn. of HER4 expression
CC   vectors, primers and probes to detect and/or clone HER4, and
CC   diagnostic reagents.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     On Sep 22, 1998 this sequence version replaced gi:3080429.
            Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://weface.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=C49G9
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
```

```
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone C49G9.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone F33E2 is at 6282 in this sequence. The
            true right end of clone W02D9 is at 109 in this sequence. The end
            of this sequence (6282. .6393) overlaps with the start of sequence
            Z84574.

  JOURNAL   Submitted (09-FEB-1995)
COMMENT               Submitted by:
                      Genome Sequencing Center
                      Department of Genetics, Washington University,
                      St. Louis, MO  63110, USA, and
                      Sanger Centre, Hinxton Hall
                      Cambridge CB10 IRQ, England
                      e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NEIGHBORING COSMID INFORMATION:

            The 5' cosmid is F01F1 (500 bp overlap); gap on 3' end.  Actual
            start of this cosmid is bp 497 of this sequence; and ends at 46255
            of this sequence

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder (P. Green and L. Hillier, ms in
            preparation).

COMMENT On Oct 7, 1997 this sequence version replaced gi:2464982.
IMPORTANT: This sequence is unfinished and does not necessarily represent the correct sequence. Work on the sequence is in progress and
the release of this data is based on the understanding that the sequence may change as work continues. The sequence may be contaminated
with foreign sequence from E.coli, yeast, vector, phage etc. Order of segments is not known; 800 n's separate segments.

TITLE Direct Submission
JOURNAL Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre, Hinxton, Cambridge CB10 1RQ, England and Department of Genetics, Washington University, St. Louis, MO 63110, USA. E-mail: jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other available information.
For a graphical representation of this sequence and its analysis see:-
http://webace.sanger.ac.uk/cgi-bin/display?db=wormace&class=Sequence &object=Y17G7B
Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.
IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small

overlap between neighbouring submissions.
IMPORTANT: This sequence is not the entire insert of clone Y17G7B. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.
The true right end of clone W03C9 is at 100 in this sequence. The true right end of clone Y17G7 is at 143092 in this sequence. The start of this sequence (1. .100) overlaps with the end of sequence Z66516.

            * This sequence is unfinished. It consists of 15 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *        1     2258: contig of 2258 bp in length
            *     2259     2275: gap of unknown length
            *     2276     4628: contig of 2353 bp in length

  AUTHORS   Waterston,R.
  TITLE     Direct Submission
  JOURNAL   Submitted (21-AUG-1997) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
COMMENT     SUBMITTED BY:
            Genome Sequencing Center
            Department of Genetics
            Washington University
            St. Louis MO 63108, USA
            http://genome.wustl.edu/gsc
            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            This clone is from the first BAC library from Genome Systems, Inc.
            (http://www.genomesystems.com).
            Cell line:  lymphoblastoid
            Haplotypes:  two
            VECTOR:  pBeloBAC
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The actual start of this clone is at base position 1 of GS055K18;
            actual end is at 200167 of GS055K18.  The orientation of this clone
            is unknown.

            This clone contains 2 runs of A's, with varying numbers of A's,
```

```
            represented on both strands.  The regions are bases 99673-99691 and
            193551-193565.  This sequence represents the largest number in each
            run.

            This clone contains STS sWSS182 (NID:g292551).

COMMENT     On Aug 4, 1998 this sequence version replaced gi:2546913.
            Order of segments is not known; 800 n's separate segments.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc.
            ***                                                          ***

            * This sequence is unfinished. It consists of 35 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1     1600: contig of 1600 bp in length
            *    1601     1618: gap of unknown length
            *    1619     3213: contig of 1595 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (06-JUN-1996) Dept. of Biology 0322, University of
            California, San Diego, 9500 Gilman Drive, La Jolla, CA 92093-032,
            USA
COMMENT     mkcA was cloned as a morphological suppresser of tagB. mkcA null
            strains are essentially indistinguishable from the wild type.  mkcA
            mRNA is expressed at equal levels in vegetative cells and in both
            prespore and prestalk cellls.  The predicted protein is a putative
            protein kinase, homologous to STE20 and PAK65.

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult Lung library. cDNA Library Preparation: M.
            Fatima Bonaldo, Ph.D. Clone distribution: clones will be available
            through Research Genetics
            Seq primer: M13 Forward.
FEATURES             Location/Qualifiers
     source          1. .430
                     /organism="Rattus norvegicus"
                     /strain="Sprague-Dawley"
                     /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                     polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-A1
                     library is a subtracted library derived from the UI-R-A0
                     library. The UI-R-A0 library consisted of a mixture of
                     individually tagged normalized libraries constructed from
                     rat placenta, adult lung, brain, liver, kidney, heart,
                     spleen, ovary, and muscle. The tag is a string of 3-5
                     nucleotides present between the Not I site and the
                     oligo-dT track which allows identification of the library
                     of origin of a clone within the mixture. The subtracted
                     library (UI-R-A1) was constructed as follows: PCR
                     amplified cDNA inserts from a pool of approximately 3,840
                     UI-R-A0 clones from which 3' ESTs had been derived was
                     used as a driver in a hybridization with the UI-R-A0
                     library in the form of single-stranded circles. The
                     remaining single-stranded circles (subtracted library) was
                     purified by hydroxyapatite column chromatography,
                     converted to double-stranded circles and electroporated
                     into DH10B bacteria (Life Technologies) to generate the
                     UI-R-A1 library. This procedure has been previously
                     described (Bonaldo, Lennon and Soares, Genome Research 6:
                     791-806, 1996)"

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult Lung library. cDNA Library Preparation: M.
            Fatima Bonaldo, Ph.D. Clone distribution: clones will be available
            through Research Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .125
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-A1
                      library is a subtracted library derived from the UI-R-A0
                      library. The UI-R-A0 library  consisted of a mixture of
                      individually tagged normalized libraries constructed from
                      rat placenta, adult lung, brain, liver, kidney, heart,
                      spleen, ovary, and muscle. The tag is a string of 3-5
                      nucleotides present between the Not I site and the
                      oligo-dT track which allows identification of the library
                      of origin of a clone within the mixture. The subtracted
                      library (UI-R-A1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of approximately 3,840
                      UI-R-A0 clones from which 3' ESTs had been derived was
                      used as a driver in a hybridization with the UI-R-A0
                      library in the form of single-stranded circles. The
                      remaining single-stranded circles (subtracted library) was
                      purified by hydroxyapatite column chromatography,
                      converted to double-stranded circles and electroporated
                      into DH10B bacteria (Life Technologies) to generate the
                      UI-R-A1 library. This procedure has been previously
                      described (Bonaldo, Lennon and Soares, Genome Research 6:
                      791-806, 1996)"

```

```
            The following repetitive elements were found in this cDNA sequence:
            20-234, B3#SINE/B2
            Seq primer: M13 Forward.
FEATURES                Location/Qualifiers
     source             1. .312
                        /organism="Rattus norvegicus"
                        /strain="Sprague-Dawley"
                        /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                        polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-Y0
                        library is a subtracted library derived from an
                        individually-tagged normalized whole-eye (minus the lens)
                        library. The driver for the subtraction consisted of a
                        pool of all previous libraries (UI-R-A0, UI-R-A1, UI-R-E0,
                        UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of
                        3-5 nucleotides present between the Not I site and the
                        oligo-dT track which allows identification of the library
                        of origin of a clone within the mixture. The subtracted
                        library (UI-R-Y0) was constructed as follows: PCR
                        amplified cDNA inserts from previous library clones from
                        which 3' ESTs had  been derived were used as a driver in a
                        hybridization with the normalized  whole-eye library in
                        the form of single-stranded circles. The remaining
                        single-stranded circles (subtracted library) was purified
                        by hydroxyapatite column chromatography, converted to
                        double-stranded circles and electroporated into DH10B
                        bacteria (Life Technologies) to generate the UI-R-Y0
                        library. This procedure has been previously described
                        (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                        1996)"

```
                     /organism="Rattus norvegicus"
                     /strain="Sprague-Dawley"
                     /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                     polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C1
                     library is a subtracted library derived from the UI-R-C0
                     library, which is a subtracted library derived from the
                     UI-R-A1 and UI-R-E1 libraries. The UI-R-A1 library
                     consisted of a mixture of  individually tagged normalized
                     libraries constructed from rat placenta,  adult lung,
                     brain, liver, kidney, heart, spleen, ovary, and muscle.
                     The UI-R-E1 library  consisted of a mixture of
                     individually tagged normalized libraries constructed from
                     8, 12 and 18-day embryo. The tag is a string of 3-5
                     nucleotides present between the Not I site and the
                     oligo-dT track which allows identification of the library
                     of origin of a clone within the mixture. The subtracted
                     library (UI-R-C1) was constructed as follows: PCR
                     amplified cDNA inserts from  UI-R-C0 clones from which 3'
                     ESTs had been derived was used as a driver in a
                     hybridization with the UI-R-C0 library in the form of
                     single-stranded circles. The remaining single-stranded
                     circles (subtracted library) was purified by
                     hydroxyapatite column chromatography, converted to
                     double-stranded circles and electroporated into DH10B
                     bacteria (Life Technologies) to generate the UI-R-C1
                     library. This procedure has been previously described
                     (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                     1996)"

                     /organism="Rattus norvegicus"
                     /strain="Sprague-Dawley"
                     /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                     polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-Y0
                     library is a subtracted library derived from an
                     individually-tagged normalized whole-eye (minus the lens)
                     library. The driver for the subtraction consisted of a
                     pool of all previous libraries (UI-R-A0, UI-R-A1, UI-R-E0,
                      UI-R-E1, UI-R-C0, and UI-R-C1). The tag is a string of
                     3-5 nucleotides present between the Not I site and the
                     oligo-dT track which allows identification of the library
                     of origin of a clone within the mixture. The subtracted
                     library (UI-R-Y0) was constructed as follows: PCR
                     amplified cDNA inserts from previous library clones from
                     which 3' ESTs had been derived were used as a driver in a
                     hybridization with the normalized whole-eye library in
                     the form of single-stranded circles. The remaining
                     single-stranded circles (subtracted library) was purified
                     by hydroxyapatite column chromatography, converted to
                     double-stranded circles and electroporated into DH10B
                     bacteria (Life Technologies) to generate the UI-R-Y0
                     library. This procedure has been previously described
                     (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 538; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Detection of polymorphic genetic markers of the form
PT   (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
PS   Claim 1; Column 41-42; 186pp; English.
CC   The invention relates to the isolation of polymorphic repeat sequences
CC   having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic
CC   markers.  Primers based on these sequences can be used to detect these
CC   repeats, especially for use in e.g paternity or maternity testing,
CC   human genetic analysis such as linkage analysis of genetic disease,
CC   commercial animal or plant breeding or pedigree analysis.  The clones
CC   T65652-T65703 are examples of the amplified polymorphic repeat sequences
CC   found at the loci given in the DE line.  The repeat sequences were
CC   isolated by hybridisation of chromosome-specific phage libraries with
CC   a synthetic poly(dC-dA).(dG-dT) probe.  Over 100 repeat blocks were
CC   isolated.  Those clones where the repeat sequence has been determined
CC   are shown in T65704-797.

PT   New Plasmodium falciparum erythrocyte membrane proteins - used to
PT   develop products for the diagnosis, treatment or prevention of
PT   malaria parasite infections
PS   Disclosure; Figure 12; 149pp; English.
CC   A polypeptide comprising a Plasmodium falciparum (Pf) erythrocyte
```

```
CC   membrane protein 1 (PfEMP1) or active fragments or analogues of that
CC   protein can be used in the treatment or prevention of symptoms of a
CC   malaria parasite infection.  The polypeptides can inhibit, block or
CC   reverse the sequestration of erythrocytes in patients suffering from
CC   malaria. Nucleic acids derived from the PfEMP1 gene can be used as
CC   probes and primers to identify a Plasmodium falciparum parasite, the
CC   primers used to generate characteristic amplification patterns from
CC   different P. falciparum strains. Antibodies specifically
CC   immunoreactive with the PfEMP1 polypeptide or its fragments may be
CC   used in diagnosis of malaria infection. This sequence encodes a
CC   truncated version of the PfEMP1 protein of the MC type of Plasmodium
CC   falciparum encoded by a cDNA clone.  A full length genomic clone
CC   coding sequence is described in T41852.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1486; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Eukaryotic cells transformed with mammalian phospholipid or
PT   protein kinase DNA - useful in assays for compounds involved in
PT   cell growth regulation and for treating cancers
PS   Disclosure; Page 42-44; 71pp; English.
CC   The sequences given in Q57014-17 encode protein kinase C (PKC)
CC   epsilon, gamma, delta and nu respectively.  These sequences were
CC   transformed into Schizosaccharomyces pombe cells under the regulatory
CC   control of the nmt promoter in an embodiment of the invention.  In the
CC   presence of thiamine the promoter is inactive and the cells carrying
CC   the PKC plasmids grow as the parental strain.  In the absence
CC   of thiamine the nmt promoter functions and the PKC is induced.  PKC
CC   activity is substantially increased under these conditions.  Cells
CC   containing constructs such as this, are useful in assays for detecting
CC   compounds involved in cell growth regulation.  It is also used as the
CC   basis for detecting compounds for treating cancers and the formation
CC   of blood vessel plaques.

PT   DNA encoding human CENP-C and its antibodies - for detecting
PT   anti-centromere antibodies in patients with auto-immune diseases
PS   Claim 1; Page 40; 68pp; English.
CC   The sequence is that of a gene encoding the human CENP-C antigen
CC   which can be used to produce the human CENP-C polypeptide in large
CC   amts. Thus the polypeptide is available to more accurately classify
CC   patients with such autoimmune rheumatic diseases as CREST syndrome,
CC   and commercially useful quantities are available for use in
CC   diagnostic systems.

PT   New T-cadherin polypeptide(s) and corresp. nucleic acid sequences
PT   - useful for treatment and diagnosis of cancer, and for repair of
PT   neuronal injury
PS   Disclosure; Fig 2A; 51pp; English.
CC   The inventors claim a purified T-cadherin polypeptide (T-cad)
```

```
CC   (T = truncated) and the nucleic acid sequence encoding it.  T-cad
CC   refers to polypeptides having substantially the amino acid sequence
CC   in R27823 and R27824, and which are cross-reactive with antibodies
CC   reactive with T-cad, but not with N-cadherin, E-cadherin, P-cadherin
CC   and L-CAM.  Two forms of T-cadherin identified in the invention
CC   lack the cytoplasmic portion found in all other members of the
CC   cadherin family.  One form of T-cadherin, referred to as T-cad 1,
CC   appears to be anchored to the membrane through a glycosyl
CC   phosphatidylinositol (GPI) linkage.  The other form, T-cad 2, is
CC   predicted by the cDNA to contain sequences for a hydrophobic domain
CC   followed by 5 cytoplasmic AAs.  From preliminary transfection of this
CC   cDNA into COS-cells, it is likely that this form is also GPI-linked.
CC   The extracellular portion of both forms are identical and contain
CC   structural features characteristic of the cadherin family.  The two
CC   forms differ in their COOH-terminal region in that T-cad 2 cDNA encodes
CC   five additional AAs.  The cDNA was isolated from a cDNA library
CC   generated from embryonic day 13 chicken brain.

PT   Detection of protein phosphatase 2C activity - as a marker for the
PT   diagnosis and therapy of cancers and diseases due to aberrant
PT   phosphorylation caused by altered PP2C activity
PS   Example 10; Page 77; 101pp; English.
CC   2 Lambda clones containing the adeno associated virus (AAV)
CC   integration site in cells were prepd.  One was derived from the
CC   Chinese hamster cell CO60 designated lambda SL9-1, of which parts
CC   were sequenced (T62453 and T62454).  A further sequence, AN8T7
CC   (T62456), was derived from plasmid pSL9-8.  The second lambda phage
CC   was cloned from cell line DA3J7.  Portions were subcloned to
CC   plasmids and a partial sequenced, designated 5h-1 (T62455), was
CC   shown to be homologous to AN8T7.  The role of integrated AAV in the
CC   modulation of protein phosphatase 2C-alpha expression was
CC   investigated.

PT   Human apolipoprotein (a) gene promoter - useful in genetic
PT   engineering and gene therapy and in the treatment of atherosclerosis
PS   Claim 1; Column 13-16; 16pp; English.
CC   The present sequence represents human apolipoprotein(a) gene 5'
CC   regulatory region. The present invention also describes: (1) a vector
CC   containing human apolipoprotein(a) gene 5'-regulatory region DNA; (2)
CC   an isolated nucleotide sequence comprising at least 30 consecutive
CC   nucleotides of human apolipoprotein(a) gene 5'-regulatory region DNA
CC   or its complement; (3) a nucleotide sequence of at least 15 nucleotides
CC   capable of forming a DNA triplex with human apolipoprotein(a) gene 5'
CC   regulatory region DNA; and (4) a transfected mammalian cell containing
CC   human apolipoprotein(a) gene 5'-regulatory region DNA where the
CC   heterologous sequence codes for an enzyme. The new promoter sequence is
CC   useful in genetic engineering and gene therapy. The promoter can
CC   specifically be used for regulating the expression of apolipoprotein(a),
CC   which is useful in the treatment of atherosclerosis.

PT   Recombinant thermostable DNA polymerase from archaebacteria -
PT   expressed efficiently by removal of intervening introns
PS   Claim 1; Fig 6; 63pp; English.
CC   This sequence represents the T. litoralis DNA polymerase gene.  The
CC   introns marked are as decribed in the specification, however the
CC   described protein sequence appears to be translated through these
CC   intronic sequences.  This T. litoralis sequence may be derived from
CC   bacteriophage NEB #619 on an approx. 14kb BamHI restriction fragment.
CC   When this gene is transformed in to E. coli and expressed in its
CC   entirety, it is found to be unstable.  There is a high frequency of
CC   mutation in the polymerase gene, cell growth is slow and there is some
CC   degree of cell mortality.  This instability is due in part to the
CC   presence of the two introns.  It is thought that the intervening DNA
CC   in this sequence encodes a separate protein which may be spliced out
CC   at the protein level.  The second, 1170bp, intron has been found to
CC   code for an endonuclease which self splices out in E. coli.  To
CC   improve stability of the DNA when it is expressed in E. coli, the
CC   specification states that it is desirable to delete the introns
CC   before transformation of the expression vector into E. coli.

PT   Modified proteins - comprising target protein and controllable
PT   intervening protein sequence.
PS   Disclosure; Page 31-34; 73pp; English.
CC   New modified proteins comprise a target protein and a controllable
CC   intervening protein sequence (CIVPS), the CIVPS being capable of
CC   excision or cleavage under predetermined conditions. Pref. CIVPSs
CC   include CIVPS1 and 2 from T.litoralis (=Vent IVPS1 and 2 or IVS1
CC   and 2) and CIVPS 3 from Pyrococcus sp. (=Deep Vent IVPS1 or IVS1).
CC   These CIVPSs are capable of excision, i.e. removal via protein
CC   splicing, from modified proteins upon an increase in temp.
CC   This can be used to inactivate protein activity and also
CC   to restore the activity of an inactivated protein.

PT   New thermostable DNA polymerase from Thermococcus.littoralis -
PT   used for second strand synthesis in DNA cloning, sequencing and
PT   amplification.
PS   Claim 12; Fig 6; 43pp; English.
CC   The sequence was obtd. from a 14 kb BamHI restriction fragment of
CC   bacteriophage NEB6199 ATCC 40795). The sequence contains an intron
CC   or intervening sequence in DNA polymerase consensus region III.
CC   The left side of the T. litoralis homogy island III begins at nt.
CC   1737 and the right side can be picked up at nt. 3384.  The sequence
CC   can be mutated to delete the intron and used to express the poly-
CC   merase.  The enzyme can be used in cloning and PCR.

PT   New isolated thermostable DNA polymerase - obtd. from isolate 9 deg.
PT   N-7, useful for amplifying, detecting and/or cloning nucleic acid
PT   sequences
PS   Example 3; Fig 6; 90pp; English.
CC   A DNA-polymerase gene (T17546) was identified on a 14 kb BamHI
CC   fragment of phage NEB619 (ATCC 40795), obtd. by screening genomic
CC   libraries of Thermococcus litoralis NS-C, an archaebacterium
CC   isolated from a submarine thermal vent.  The gene codes for
CC   a thermostable DNA polymerase having 3' to 5' exonuclease
CC   activity and 3'-5' proofreading ability, and which gave good
CC   results in the PCR amplification of esp. very small amounts (e.g.
CC   2.8 fg) of DNA.  The gene has been cloned into Escherichia coli.
CC   Prodn. of large amounts of recombinant enzyme was complicated by
CC   the presence of 2 introns which both encode an endonuclease that
CC   is spliced out in E. coli.

PT   Modified protein comprising target protein and controllable
PT   intervening protein - that can be removed by excision or cleavage
PT   under specific conditions, useful for prepn. and purificn. of
PT   recombinant proteins that are normally toxic to cells
PS   Disclosure; Page 103-106; 161pp; English.
CC   The Thermococcus litoralis Vent DNA polymerase gene (T70812)
CC   includes 2 controllable intervening protein sequence elements,
CC   CIVPS1 and CIVPS2, deposited in phage NEB 619 (ATCC 40795).  The
CC   Pyrococcus Deep Vent polymerase gene (T70813) contains another such
CC   element, CIVPS3.  A modified protein comprises a target protein
CC   (TP) and a CIVPS that can be removed by excision under specific
CC   conditions, i.e. an increase in temperature.  The CIVPS is inserted
CC   into, or fused to, the TP in such a way as to render the TP
CC   inactive, but activity is restored upon excision of the CIVPS.
CC   This can be used e.g. to control the enzymatic activity of a TP, to
CC   facilitate purification of a TP and to permit prodn. of a TP which
CC   in native form is toxic to the cells expressing it.  The TP may be
CC   an enzyme, toxin, cytokine, glycoprotein, growth factor etc.

PT   Polymorphic bovine DNA markers - used in genetic identification,
PT   gene mapping, and selective breeding
PS   Table 7; Page 359; 517pp; English.
CC   The sequence is that of a bovine microsatellite sequence obtd. by
CC   screening a library of bovine MboI DNA fragments of between
CC   250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe.
CC   One out of 50 clones cross-hybridised.  Assuming independent
CC   distribution of microsatellites and MboI sites, the frequency of
CC   (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC   000.  The sequence information for ca. 230 such bovine microsatellites
CC   is summarised in the specification and indexed herein (see below).
CC   The sequences upstream and downstream of the microsatellite sequence
CC   were used to generate the required PCR primers for in vitro
CC   amplification of the corresp. microsatellite (using the program
CC   OPTIPRIM).  The microsatellites may be used to identify individuals,
CC   for parentage testing, and in the genetic mapping of economic trait
CC   loci, or genes involved the determinism of economically important
CC   traits esp. in cattle, to allow selective breeding.

PT   Novel ribosome DNA probe sequences - for the accurate identification
PT   of grape cultivars
PS   Claim 26; Fig 5h; 55pp; English.
CC   The sequences given in Q55231-50 are derived from ribosomes of the
CC   grapevine genus Vitis.  These sequences represent the IGS region of
CC   the ribosomal (r)DNA repeat and contain polymorphisms.  These
CC   polymorphisms may be used in a method for the identification of
CC   different grape cultivars.  These clones contain simple repeat
CC   sequences and were identified in a genomic library of grapevine DNA
CC   using simple di-, tri- or tetra- nucleotide repeats such as (AT)8,
CC   (GT)10, (CGT)10 and such like as probes.

PT   Determn. of the common hereditary haemochromatosis gene mutation -
PT   using primers based on novel microsatellite repeat flanking
PT   sequences or on base-pair polymorphisms HHP-1, HHP-19 or HHP-29
PS   Claim 24; Fig 1E; 67pp; English.
CC   The sequences given in T72045-67 represent portions of the genome
CC   surrounding several markers of the invention.  The markers were
CC   identified using the series of primer pairs given in T71973-2044
CC   which were used to determine the presence or absence of the common
CC   hereditary haemochromatosis (HH) gene mutation in an individual.  The
CC   method comprised assessing genomic DNA from an individual for the
CC   presence or absence of the HH-associated allele of the single base-pair
CC   polymorphism HHP-1, HHP-19 or HHP-29, and/or at least one non-optional
CC   marker comprising the following microsatellite repeat alleles of group
CC   A and optionally of group B:
CC   Group A: 1D9, 18B4, 1A2, 1E4, 24E2, 2B8, 3321-1, 4073-1, 4440-1, 4440-2,
CC   731-1, 5091-1, 3216-1, 4072-2, 950-1, 950-2, 950-3, 950-4, 950-5, 950-6,
CC   950-8, 63-1, 63-2, 63-3, 65-1, 65-2, 373-8, 373-29, 68-1, 241-6, 241-29;
CC   Group B: D6S464, D6S306, D6S258, D6S265, D6S105 and D6S1001.
CC   The absence of the genotype indicates the likelihood of the presence of
CC   the HH mutation.  Knowledge of the new genetic markers allows the
CC   definition of genotypes characteristic of heterozygous carriers and
CC   homozygotes having a HH mutation in their genomic DNA. The potential for
CC   HH in an individual interferes with the effectiveness of interferon
CC   treatment for hepatitis C infection.  By diagnosing this potential, the
CC   responsiveness of interferon treatment may be evaluated.
CC   Note:  Some of the sequences given in this specification are unclear due
CC   to poor print quality.  This sequence is derived from the related patent,
CC   WO9635803.

PT   DNA encoding human alpha3(IX) collagen protein - used to screen for
PT   collagen-related disease, also in gene or autologous cell therapy
PS   Claim 2; Fig 5; 54pp; English.
CC   A cDNA clone (T67055) codes for novel human alpha3(IX) collagen
CC   (W15287).  It was obtd. by PCR amplification of human chondrocyte
CC   cDNA and genomic DNA (see also T67067-77).  The cDNA clone can be
CC   expressed in host/vector systems, partic. Pichia pastoris or
CC   Hansenula polymorpha, or in transgenic animals with recovery of
CC   collagen from the milk.  Alpha3(IX) collagen polynucleotides can
CC   also be used diagnostically to detect aberrant gene expression in
CC   disease states, e.g. rheumatoid arthritis, osteoarthritis, reactive
CC   arthritis, autoimmune hearing disease, cartilage inflammation,
CC   parasitic disease; bursitis, corneal diseases and ankylosing
CC   spondylitis.  They can also be used therpeutically, in gene or
CC   autologous cell therapy, or as antisense molecules in cases of
CC   overexpression of alpha3(IX) collagen.

PT   New fungus lacking functional AreA and extracellular protease
PT   gene(s) - for high yield expression of industrial or therapeutic
PT   proteins, also new protease(s) from Aspergillus oryzae
PS   Example 2; Page 35-38; 80pp; English.
CC   This DNA sequence includes a coding region for the serine
CC   protease PepC (see W31629) of Aspergillus oryzae.  The pepC gene
CC   was cloned by cross-hybridisation with the Aspergillus niger pepC
CC   gene.  The invention relates to a new fungus in which: (a) the areA
CC   gene (see T97394) has been modified by recombinant DNA methods so
CC   that it cannot express a functional AreA activator; and (2) the
CC   extracellular protease pepE (see T97392) and/or pepC genes are
CC   inactivated so that functional enzyme is not produced.  The
CC   fungi have complete or partial deletions of the appropriate genes,
CC   or expression sequences that regulate the genes.  Alternatively,
CC   the genes are inactivated by antisense mechanisms or by gene
CC   replacement.  The new fungi are used for the recombinant production
CC   of industrial or therapeutic peptides and proteins, particularly
CC   enzymes (e.g. proteases, lipase, cutinase, cellulase or chymosin),
CC   insulin, growth hormone, glucagon, somatostatin, interferon,
CC   platelet-derived growth factor, factor VII, factor VIII, urokinase,
CC   tissue plasminogen activator, erythropoietin or thrombopoietin.
CC   The new fungi do not produce protease and so provide higher yields
CC   of recombinant protein because of reduced proteolytic degradation.
CC   The isolated pepE and pepC genes can also be used for production of
CC   recombinant Pep proteases.

PT   New malaria vaccines - contains cysteine-rich DBL family protein
PT   binding domains homologous domains of the Duffy and sialic acid
PT   binding proteins
PS   Claim 4; Page 56-61; 96pp; English.
CC   This sequence represents the var-7 gene of Plasmodium. Var-7 belongs to
CC   the Duffy binding like (DBL) family of genes which have homology to the
CC   Duffy antigen binding protein (DABP) and sialic acid binding protein
CC   (SABP) conserved regions (see T72889 and T72888 respectively). The var
CC   family of genes modulate cytoadherence and antigenic variation of
CC   Plasmodium infected erythrocytes. SABP and the Duffy antigen binding
CC   protein (DABP) are soluble proteins that appear in the culture
CC   supernatant after infected erythrocytes release merozoites. DABP and SABP
CC   mediate the binding of merozoites and schizonts to the erythrocyte
CC   surface. These proteins are necessary for erythrocyte invasion by the
CC   parasite. This sequence can be used in the compositions of the invention.
CC   The compositions are for the treatment and prevention of malaria, and
CC   comprise either a nucleotide sequence or encoded polypeptide of the
CC   var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of
CC   genes having homology with conserved regions of DABP and SABP. The
CC   compositions are used for the treatment and prevention of malaria. They
CC   are also used in the preparation of vaccines for inducing a protective
CC   immune response in a mammal to Plasmodium merozoites (especially
CC   Plasmodium falciparum or Plasmodium vivax).

PT   Determination of genotype of an IL-6 gene in an individual - used
PT   for diagnosis of or identification of a predisposition or
PT   susceptibility to a disease, particularly osteoporosis
PS   Claim 14; Page 4; 20pp; English.
CC   The present sequence represents an interleukin 6 non-risk genotype
CC   sequence from the present invention. The present invention describes an
CC   in vitro method of diagnosis of a disease in an animal. The method
CC   comprises determining the genotype of an interleukin-6 (IL-6) gene in
CC   the animal. The invention also describes: (1) a method of identifying an
CC   animal predisposed or susceptible to a disease, comprising determining
CC   the genotype of an IL-6 gene in the animal; (2) a composition for use in
CC   diagnosing a disease in an animal, the composition comprising one or
CC   more primer nucleic acid molecules adapted to amplify a portion of a
CC   3' flanking region of an IL-6 gene in the animal; and (3) a composition
CC   for use in identifying an animal predisposed or susceptible to a
CC   disease, the composition comprising one or more primer nucleic acid
CC   molecules adapted to amplify a portion of a 3' flanking region of an
CC   IL-6 gene in the animal. The method can be used for the diagnosis of
CC   or identifying predisposition or susceptibility to a disease,
CC   particularly osteoporosis.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 2184; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Detection and identification of organisms - using DNA primers to
PT   amplify signature segment of organism's type II topoisomerase
PS   Claim 6; Column 177-178; 114pp; English.
```

```
CC   A method has been produced for selectively amplifying DNA segments of
CC   one or more species of organisms in a sample. The method involves: (a)
CC   providing a database containing reference sequences, comprising a
CC   subunit sequence of a signature region of a macromolecule selected from
CC   a type II topoisomerase (TopoII), or a homologue, where each reference
CC   sequence is specific to a different species of a chosen group, and the
CC   macromolecule comprises 1st and 2nd conserved regions adjacently
CC   flanking the signature region; and (b) making an extract of DNA
CC   molecules, and selectively amplifying DNA segments of the signature
CC   region using a universal primer composition, comprising a primer
CC   constructed to bind a DNA encoding the macromolecule, to produce
CC   amplified DNA segments. The present sequence represents a DNA fragment
CC   containing a signature segment which is used in the database as a
CC   reference sequence for Spirocheata aurantia. The method can be
CC   used to identify all of the different organisms present in a single
CC   sample without using multiple probes. It can accurately distinguish
CC   among similar and related species, and can be used with, e.g.
CC   contaminated food products, tissue or fluid samples from diseased
CC   humans, animal or plants, soil samples and water samples from any
CC   source.

PT   New expression cassettes inducible by methanol and/or glycerol -
PT   having promoter and terminator derived from alcohol oxidase gene
PS   Claim 6; Page 22; 37pp; English.
CC   An expression cassette which contains the alcohol oxidase promoter
CC   is induced when in the presence of methanol/glycerol.  Under such
```

```
CC   conditions any heterologous gene located downstream of the promoter
CC   will be expressed.  The expression cassette can be used to construct
CC   an expression vector which in turn can be used to transform cells.
CC   When transformed cells are cultured in the presence of methanol/
CC   glycerol expression of the heterologous gene is induced such that
CC   large quantities of the desired product is produced.  The
CC   transformed cells are used particularly for the production of
CC   enzymes such as adenylate kinases, cytochrome C and peroxidases.
CC   The autonomously replicating sequence is used in the construction
CC   of the expression vector, conferring the ability of replication
CC   on the expression vector.

PT   Nucleic acid fragment for inhibiting retinoblastoma protein
PT   synthesis - has sequence complementary to 3'-UTR of mouse Rb gene,
PT   useful in anti:sense gene therapy to inhibit cancer and leukaemia
PT   cell growth
PS   Disclosure; Page 9-10; 12pp; Japanese.
CC   Sequences T01541-3 are nucleic acid fragments contg. antisense sequences
CC   to the 3' untranslated region of the mouse retinoblastoma gene. The
CC   sequences were PCR amplified using the primers T01544-9 on RNA isolated
CC   from mouse Balb/c 3T3 cells as a template.  The sequences were inserted
CC   under control of the cytomegalovirus promoter to produce plasmid pRc/CMV
CC   for expression in animal cells.  Vectors contg. the antisense sequences
CC   can be used to inhibit the synthesis of the retinoblastoma protein in an
CC   animal cell, esp. for inhibiting the growth of cancer or leukaemia cells.

PT   Isolated nucleic acid clones from ATCC 98028 encode novel secreted
PT   proteins - having many potential uses, e.g. as immunomodulators,
PT   cell proliferation or differentiation inhibitors or haematopoiesis
PT   regulators
PS   Claim 14; Page 63-64; 114pp; English.
CC   This sequence is an internal fragment of clone G52_24, which is a
CC   polynucleotide of the invention. This sequence was isolated from a human
CC   peripheral blood mononucleocyte (PBMC) cDNA library. The polynucleotide,
CC   which encodes a secreted protein, can be used, e.g. as a tissue or
CC   molecular weight marker, in genetic fingerprinting, to raise anti-protein
CC   or anti-DNA antibodies and in interaction trap assays. The protein can be
CC   used to assay biological activity, raise antibodies for use in
CC   immunoassays, as a marker, to identify inhibitors of its interactions and
CC   as a nutritional supplement. It may also have a very wide range of
CC   therapeutic and biological activities (no examples are given to support
CC   this), e.g. cytokine or modulator of cell proliferation and
CC   differentiation, immunostimulant or immunosuppressant, haematopoiesis
CC   regulator, bone, cartilage, tendon, ligament and/or nerve tissue growth
CC   stimulator, follicle inhibitor/stimulator, chemotactic/chemokinetic,
CC   haemostatic, thrombolytic or anti-inflammatory agent, antimicrobial,
CC   biorhythm, metabolism or behaviour modifier, anti-depressant or analgesic
CC   or psoriasis treatative.

PT   Two new ligands, FRL-2 and FRL-1 for the FGF receptor  - used in
PT   treatment of neural disorders, e.g. tumours, in vertebrate cells
PS   Claim 1; Page 41-43; 83pp; English.
CC   2 Genes (T15607 and T15608) encoding novel fibroblast growth factor
CC   (FGF) receptor ligands, FRL-2 (R90767) and FRL-1 (R90768), were
CC   isolated by screening a Xenopus laevis egg cDNA library with
CC   Saccharomyces cerevisiae PSY316 cells expressing FGF receptor,
CC   using a functional expression technique.  FRL-1 and FRL-2 are
CC   involved in transmembrane receptor-mediated signalling.  The cDNAs
CC   may be labeled and used as probes or primers to detect vertebrate
CC   FRL-2 or FRL-1 cDNAs, used to produce the recombinant ligands, or
CC   used in gene therapy as a means of modulating the function of FGF
CC   receptors in vertebrate cells or tissues.

PT   Nucleic acid fragment for inhibiting retinoblastoma protein
PT   synthesis - has sequence complementary to 3'-UTR of mouse Rb gene,
PT   useful in anti:sense gene therapy to inhibit cancer and leukaemia
PT   cell growth
PS   Disclosure; Page 9; 12pp; Japanese.
CC   Sequences T01541-3 are nucleic acid fragments contg. antisense aequences
CC   to the 3' untranslated region of the mouse retinoblastoma gene. The
CC   sequences were PCR amplified using the primers T01544-9 on RNA isolated
CC   from mouse Balb/c 3T3 cells as a template.  The sequences were inserted
CC   under control of the cytomegalovirus promoter to produce plasmid pRc/CMV
```

PT   Anti-sense RNA expression vector - useful for suppressing expression
PT   of a protein, e.g. retinoblastoma protein, which regulates cellular
PT   proliferation, for cancer therapy
PS   Example 2; Page 20-21; 30pp; Japanese.
CC   This sequence represents the antisense sequence to nucleotides 2878-4577
CC   covering the 3' untranslated region (3' UTR) of the mouse retinoblastoma
CC   (Rb) gene.  The antisense DNA can be used to generate a DNA construct
CC   which has a first DNA sequence coding for an antisense RNA suppressing
CC   the expression of a desired protein and a second DNA sequence acting as a
CC   marker gene, in which the 5'-terminal of the second DNA sequence has a
CC   DNA sequence coding for an internal ribosomal entry site (IRES) and the
CC   3'-terminal of the second DNA sequence has a DNA sequence coding for a
CC   poly(A)-addition signal.  The antisense sequence can also be split into
CC   2 regions covering bases 2878-3778 and 3779-4577 for generation of
CC   constructs containing these regions either singly or as tandem repeats
CC   (T62393-7).  The antisense RNA expression vectors can be applied to e.g.
CC   genetic therapy of cancer, leukaemia, etc., by suppressing the expression
CC   of a protein which regulates the proliferation of cancer cells, leukaemic
CC   cells, etc.

PT   Transgenic starch producing organism - comprises exogenous ADP
PT   glucose pyrophosphorylase enzyme DNA sequence
PS   Claim 6; Fig 14; 88pp; English.
CC   Q78149 is a 1.9 kb cDNA fragment encoding the large subunit ADP-
CC   glucose pyrophosphorylase from barley endosperm (Villand et al. 1992,
CC   Plant Physiol 100: 1617-1618). For the construction of plasmid pPPL1,
CC   a 1.9 kb EcoRI-HindIII cDNA fragment encoding the barley endosperm
CC   AGP large subunit (bepl) was isolated, the restriction ends were
CC   filled in with klenow DNA polymerase, and the blunt ended DNA
CC   fragment was cloned in the SmaI site of plasmid pPATA1. From the
CC   resulting plasmid the 3.2 kb EcoRI fragment contg. the patatin
CC   promoter, the bepl cDNA, and the 35S terminator was isolated and
CC   inserted in the EcoRI site of the plant transformation vector pBKL4
CC   to yield plasmid pPPL1, which is claimed.

PT   Structural gene encoding RAD51, used in production of RAD51 - used
PT   to study drugs against diseases caused by DNA damage, e.g. by UV or
PT   X radiation, and to improve efficiency of gene therapy targetting
PS   Claim 1; Page 12-13; 19pp; Japanese.
CC   The present sequence, isolated from S.pombe DNA (chromosome 1), is a
CC   specific example of DNA coding for a RAD51 protein having the amino
CC   acid sequence in R78182. The RAD51 protein, which contains an ATP-
CC   binding domain, is involved in DNA repair of mismatched base pairs
CC   and site-specific recombination in antibody gene rearrangements. The
CC   protein binds to double-stranded DNA to form a right-handed helical
CC   nucleoprotein that extends (by 1.5 times) the pitch of B-form DNA. As
CC   a result, the helix is unwound. The Rad51 gene and the protein it
CC   encodes will be useful in designing drugs to treat diseases associated
CC   with environmental DNA damage.

    TITLE     Direct Submission
    JOURNAL   Submitted (13-JUN-1998) The Institute for Genomic Research, 9712
              Medical Center Dr., Rockville, MD 20850, USA
  COMMENT   On Jun 13, 1998 this sequence version replaced gi:3172163.
            Address all correspondence to: Mark Adams The Institute for Genomic
            Research 9712 Medical Center Dr, Rockville, MD 20850, USA e-mail
            address: mdadams@tigr.org.   The orientation of the sequence is
            from SP6 end to T7 end. Genes were identified by a combination of
            five methods including: XGRAIL (available by anonymous ftp from
            arthur.epm.ornl.gov), Genefinder (Phil Green, University of
            Washington), Genscan  (Chris Burge,
            http://gnomic.stanford.Edu/~chris/GENSCANW.html)searches of the
            complete sequence against a peptide database,and the Human gene
            Index database at TIGR (http://www.tigr.org/tdb/hgi/hgi.html).
            Genes without pepetide homolgy having spliced EST hits are termed
            'Unknown gene product'. Genes encoding tRNAs are predicted by
            tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/).

            * This sequence is unfinished. It consists of 3 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
```

```
            *        1     1704: contig of 1704 bp in length
            *     1705     1721: gap of unknown length
            *     1722    45985: contig of 44264 bp in length
            *    45986    46002: gap of unknown length
            *    46003   136569: contig of 90567 bp in length.

  AUTHORS   Worley,K.C.
  TITLE     Direct Submission
  JOURNAL   Submitted (27-JUN-1998) Human Genome Sequencing Center, Department
            of Molecular and Human Genetics, Baylor College of Medicine, One
            Baylor Plaza, Houston, TX 77030, USA
  COMMENT   On Jun 27, 1998 this sequence version replaced gi:3242669.
            Sequencing is completed to a minimum standard of double strand
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.

            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.

            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.

            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

COMMENT     On Sep 25, 1998 this sequence version replaced gi:3355576.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ526I14  Contig_ID: 09662  acc=Z82214
            Length: 65546 bp Unfinished: dJ526I14  Contig_ID: 06705  acc=Z82214

  TITLE     Direct Submission
  JOURNAL   Submitted (06-JAN-1998) sanger.ac.uk/HGP/Chr6/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Jan 9, 1998 this sequence version replaced gi:2598469.
            IMPORTANT: This sequence is the entire insert of clone 67M12.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 6, constructed by the Sanger Centre chromosome 6
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr6/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 67M12 is at 1 in this sequence. The true
            right end of clone 67M12 is at 103268.
            67M12 is from the library RPCI1 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

  TITLE     Direct Submission
  JOURNAL   Submitted (28-OCT-1997) sanger.ac.uk/HGP/ChrX/) Sanger Centre,
            Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquires:
            humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Apr 8, 1998 this sequence version replaced gi:2578085.
            IMPORTANT: This sequence is the entire insert of clone 321I15.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome X, constructed by the Sanger Centre chromosome X
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/ChrX/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
```

```
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 321I15 is at 1 in this sequence. The
            true right end of clone 321I15 is at 75793.
            321I15 is from the library RPCI1 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

            * This sequence is unfinished. It consists of 20 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *        1     1478: contig of 1478 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (21-NOV-1996) E-mail enquiries: humquery@sanger.ac.uk
            Clone requests: clonerequest@sanger.ac.uk
COMMENT     On Nov 28, 1996 this sequence version replaced gi:1666415.
            IMPORTANT:  This sequence is not the entire insert of clone N104C7.
             It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            This sequence has been finished according to sequence map criteria
            as follows.  An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu).  Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone N104C7 is at 1 in this sequence. The
            true left end of clone N117B5 is at 28766.
            N104C7 is from the human chromosome 22-specific cosmid library
            LL22NCO3, constructed at the Biomedical Sciences Division, Lawrence
            Livermore National Laboratory, Livermore, CA 94550 under the
            auspices of the National Laboratory Gene Library Project sponsored
            by the US Department of Energy.  The source of the flow sorted
            chromosomes was a human/hamster hybrid containing chromosomes Y, 22
            and 9.
            VECTOR:  Lawrist 16.
            This sequence was generated from part of bacterial clone contigs of
```

```
            human chromosome 22, constructed by the Sanger Centre Chromosome 22
            Mapping Group. Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr22.

  TITLE     Direct Submission
  JOURNAL   Submitted (08-APR-1997) Sanger Centre, Hinxton, Cambridgeshire,
            CB10 1RQ, UK. E-mail enquires: humquery@sanger.ac.uk Clone
            requests: clonerequest@sanger.ac.uk
COMMENT     On Apr 13, 1997 this sequence version replaced gi:1781020.
            IMPORTANT:  This sequence is the entire insert of clone U75A4. The
            true left end of clone U75A4 is at 1 in this sequence. The true
```

```
            right end of clone U75A4 is at 39132.
            U75A4 is from the Lawrence Livermore National Laboratory
            flow-sorted
            X chromosome cosmid library LL0XNC01.

            * This sequence is unfinished. It consists of 15 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *       1      865: contig of 865 bp in length

  TITLE     Direct Submission
  JOURNAL   Submitted (21-MAY-1997) Sanger Centre, Hinxton, Cambridgeshire,
            CB10 1SA, UK. E-mail enquires: humquery@sanger.ac.uk Clone
            requests: clonerequest@sanger.ac.uk
COMMENT     On May 25, 1997 this sequence version replaced gi:2094786.
            IMPORTANT:  This sequence is the entire insert of clone 344F17.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome 6, constructed by the Sanger Centre chromosome 6
            mapping group.  Further information can be found at
            http://www.sanger.ac.uk/HGP/Chr6/
            This sequence has been finished according to sequence map criteria
            as follows.  An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu).  Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 344F17 is at 1 in this sequence. The
            true right end of clone 344F17 is at 85832.
            344F17 is from the library RPCI3 constructed at the Roswell Park
            Cancer
            Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

  TITLE     Direct Submission
  JOURNAL   Submitted (03-JUL-1998) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
COMMENT     SUBMITTED BY:  WUGSC
            Genome Sequencing Center
            Department of Genetics
            Washington University
            St. Louis MO 63108, USA
            http://genome.wustl.edu/gsc
            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
```

Department of Genetics (Washington University), and the Washington
University Genome Sequencing Center. For additional information
about the map position of this sequence, see
http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

SOURCE INFORMATION:
Clone RG318M05 is from a release of the human BAC library
CITB-HS-A. The library contains cloned DNA from human sperm. See:
Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
Kim et al., Genomics 34:213-8 (1996). The clone is available from
Research Genetics, Inc. (http://www.resgen.com).
VECTOR: pBeloBAC11
Selection: chloramphenicol

NEIGHBORING SEQUENCE INFORMATION:
The actual start of this clone is at base position 1 of RG318M05;
actual end is at base position 94336 of RG318M05.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult 12-Day-Embryo library. cDNA Library
            Preparation: M. Fatima Bonaldo, Ph.D. Clone distribution: clones
            will be available through Research Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .213
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-E1
                      library is a subtracted library derived from the UI-R-E0
                      library.  The UI-R-E0 library  consisted of a mixture of
                      individually  tagged normalized libraries constructed from
                      8, 12 and 18-day embryo.  The tag is a string of 3-5
                      nucleotides present between the Not I site  and the
```

```
                      oligo-dT track which allows identification of the library
                      of  origin of a clone within the mixture.  The subtracted
                      library (UI-R-E1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of  UI-R-E0 clones from
                      which 3' ESTs had been derived was used as a driver in a
                      hybridization with the UI-R-E0 library in the form of
                      single-stranded circles. The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-E1
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

            Chakrabarti strain=Dd2 vector=Lambda ZAP II host=E. coli XL-1 blue
            primer=T3 Rsite1=EcoR I Rsite2=Xho I PolyA+ RNA, from asynchronous
            blood stage parasites of the Dd2 isolate cultured in vitro, was
            reverse transcribed using an oligo dT-Xho I primer.  Second strand
            was prepared using RNase H and DNA polymerase I. EcoR I adapters
            were ligated to the cDNA, and it was digested with Xho I. Prepared
            fragments were ligated into EcoR I + Xho I digested lambda ZAP II
            vector.

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult 12-Day-Embryo library. cDNA Library
            Preparation: M. Fatima Bonaldo, Ph.D. Clone distribution: clones
            will be available through Research Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .286
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C0
                      library is a subtracted library derived from the UI-R-A1
                      and UI-R-E1 libraries. The UI-R-A1 library consisted of a
                      mixture of individually tagged normalized libraries
                      constructed from rat  placenta, adult lung, brain, liver,
                      kidney, heart, spleen, ovary,  and muscle. The UI-R-E1
                      library  consisted of a mixture of individually tagged
                      normalized libraries constructed from 8, 12 and 18-day
                      embryo. The tag is a string of 3-5 nucleotides present
                      between the Not I  site and the oligo-dT track which
                      allows identification of the library of origin of a clone
                      within the mixture. The subtracted library (UI-R-C0) was
                      constructed as follows: PCR amplified cDNA inserts from a
                      pool of UI-R-A1 and UI-R-E1 clones from which 3' ESTs had
                      been derived was used as a driver in a hybridization with
                      the pooled UI-R-A1 and UI-R-E1 library in the form of
                      single-stranded circles.  The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-C0
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track served to identify it as a clone from the normalized
            adult Muscle library.  cDNA Library Preparation: M. Fatima Bonaldo,
            Ph.D. Clone distribution: clones will be available through Research
            Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .523
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C1
                      library is a subtracted library derived from the UI-R-C0
                      library, which is a subtracted library derived from the
                      UI-R-A1 and UI-R-E1 libraries. The UI-R-A1 library
                      consisted of a mixture of  individually tagged normalized
                      libraries constructed from rat placenta,  adult lung,
                      brain, liver, kidney, heart, spleen, ovary, and muscle.
                      The UI-R-E1 library  consisted of a mixture of
                      individually tagged normalized libraries constructed from
                      8, 12 and 18-day embryo. The tag is a string of 3-5
                      nucleotides present between the Not I site and the
                      oligo-dT track which allows identification of the library
                      of origin of a clone within the mixture. The subtracted
                      library (UI-R-C1) was constructed as follows: PCR
                      amplified cDNA inserts from  UI-R-C0 clones from which 3'
                      ESTs had been derived was used as a driver in a
```

```
                      hybridization with the UI-R-C0 library in the form of
                      single-stranded circles. The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-C1
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

            The sequence tag present in the cDNA between the NotI site and the
```

```
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult 18-Day-Embryo library. cDNA Library
            Preparation: M. Fatima Bonaldo, Ph.D. Clone distribution: clones
            will be available through Research Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .205
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-E1
                      library is a subtracted library derived from the UI-R-E0
                      library.  The UI-R-E0 library  consisted of a mixture of
                      individually  tagged normalized libraries constructed from
                      8, 12 and 18-day embryo.   The tag is a string of 3-5
                      nucleotides present between the Not I site  and the
                      oligo-dT track which allows identification of the library
                      of  origin of a clone within the mixture.  The subtracted
                      library (UI-R-E1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of  UI-R-E0 clones from
                      which 3' ESTs had been derived was used as a driver in a
                      hybridization with the UI-R-E0 library in the form of
                      single-stranded circles. The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-E1
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

            The sequence tag present in the cDNA between the NotI site and the
            oligo-dT track (not shown) served to identify it as a clone from
            the normalized adult 18-Day-Embryo library. cDNA Library
            Preparation: M. Fatima Bonaldo, Ph.D. Clone distribution: clones
```

```
            will be available through Research Genetics
            Seq primer: M13 Forward.
FEATURES              Location/Qualifiers
     source           1. .313
                      /organism="Rattus norvegicus"
                      /strain="Sprague-Dawley"
                      /note="Vector: pT7T3D-Pac (Pharmacia) with a modified
                      polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-E1
                      library is a subtracted library derived from the UI-R-E0
                      library.  The UI-R-E0 library  consisted of a mixture of
                      individually  tagged normalized libraries constructed from
                      8, 12 and 18-day embryo.   The tag is a string of 3-5
                      nucleotides present between the Not I site  and the
                      oligo-dT track which allows identification of the library
                      of  origin of a clone within the mixture.  The subtracted
                      library (UI-R-E1) was constructed as follows: PCR
                      amplified cDNA inserts from a pool of  UI-R-E0 clones from
                      which 3' ESTs had been derived was used as a driver in a
                      hybridization with the UI-R-E0 library in the form of
                      single-stranded circles. The remaining single-stranded
                      circles (subtracted library) was purified by
                      hydroxyapatite column chromatography, converted to
                      double-stranded circles and electroporated into DH10B
                      bacteria (Life Technologies) to generate the UI-R-E1
                      library. This procedure has been previously described
                      (Bonaldo, Lennon and Soares, Genome Research 6: 791-806,
                      1996)"

Statistics: Mean 6.322; Variance 3.119; scale 2.027

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 589; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Example 7; Fig 10; 2245pp; Japanese.
CC   Primers T41001-T41382 are derived from novel human gene signature (GS)
CC   sequences which did not match with sequences deposited in Genbank release
CC   76.  The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA
CC   libraries prepared from various human tissues; synthesis of cDNA was
CC   initiated from the 3'-end of mRNA by using poly(T) as the sole primer.
CC   Each library is constructed so as to reflect accurately the relative
CC   abundance of different mRNAs in the particular tissue from which it was
CC   derived.  The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS sequences)
CC   as a means of diagnosing abnormal cell function or for recognising
CC   different cell types. The primers T41371-2 amplify clone pm2908 which
CC   comprises the GS HUMGS001365 (T20365).  This amplification reaction gave
CC   no product.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1565; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues: synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Monomermic mammalian follistatin protein -
PT   isolated from porcine follicular fluid and prepd. by recombinant
PT   techniques, used esp. as male contraceptive
PS   Disclosure;  ; 34pp; English.
CC   The hFS gene was cloned and sequenced from a human genomic library and
CC   3 positives were obtained by hybridisation with a cDNA probe encoding
CC   the first 317 amino acids of the porcine FS (pFS) precursor. Restriction
CC   mapping and nucleotide sequence analyses reveal that one clone, which is
CC   19.1 kb in length, encodes nearly the whole human FS gene
CC   containing 5 exons. Another 15 kb clone contains only the last exon (5).
CC   It is postulated that the genomic organisation of human FS is composed
CC   of a DNA sequence that is more than 5kb in length with 6 exons
CC   interrupted by 5 introns (see n90641). This is the sequence of the third
CC   intron. The first 4 introns possess the consensus 5' - GT ... AG - 3'
CC   donor and acceptor splicing sequences.

PT   Novel di:hydro:pyrimidine dehydrogenase gene - used to optimise
PT   5-fluoro:uracil doses given to cancer patients
PS   Claim 10; Page 140-56; 207pp; English.
CC   This sequence represents the DNA sequence encoding human
CC   dihydropyrimidine dehydrogenase (DPD).  DPD catalyses the initial
CC   and rate limiting step in pyrimidine catabolism, the reduction of
CC   pyrimidines to 5,6-dihydropyrimidines.  DPD is a complex enzyme
```

```
CC   consisting of two identical subunits, containing FMN, FAD and iron-
CC   sulphur centers, and utilising NADPH as a cofactor.  DPD has also been
CC   shown to catalyse the reduction of various pyrimidine analogues
CC   including the fluoropyrimidine anticancer drug 5-fluorouracil (FUra).
CC   Up to 85% of administered FUra may be catabolised by DPD, and it
CC   therefore governs the effectiveness of FUra as an anticancer drug.
CC   DPD genes or fragments of them may be used in the detection of DPD in a
CC   sample, esp. isolated from a cancer patient.  According to the amount
CC   of DPD detected, a therapeutically effective amount of FUra may be
CC   determined and administered.  DPD deficiency, leading to life-
CC   threatening toxicity on exposure to FUra, in a human caused by a
CC   frameshift mutation may be determined by means of a molecular biological
CC   assay to detect the deletion of an A residue at codon 318 within the
CC   DPD-coding region.

PT   Protein from mouse calvarial cells - differentiates growth of
PT   osteoblast(s) and cranial nerve cells, for treating and
PT   diagnosing osteoporosis and dementia
PS   Disclosure; Fig 3(1-5); 43pp; Japanese.
CC   A cDNA library was constructed from mouse calvarial cell line
CC   MC3T3E1.  Differential screening in NIH3T3 cells (ATCC CRL-1658) and
CC   cloning, then insertion into vector pUC118 gave plasmid pMCO31 which
CC   contains the DNA coding for mouse OSP-1 (Q20695).  This plasmid was
CC   used as probe to clone by plaque hybridisation from a human cDNA
CC   library to give a phage clone, HBR1.  Insertion into vector pUC118
CC   gave pHBR1 which may be used diagnostically or the OSP-1 cDNA
CC   (Q20696) incorporated (with poly-A signal sequence and SV40 T-cell
CC   antigen promoter) into a vector (such as pHSG-757) for expression
CC   (e.g. in CHO cells) of the protein.
CC   See also Q20695-97.

PT   Altering expression of genes encoding thrombopoietin, DNase I or
PT   beta-interferon  - using DNA constructs useful in gene therapy to
PT   treat, e.g. cystic fibrosis and multiple sclerosis.
PS   Claim 47; Fig 14A-B; 115pp; English.
CC   A genomic DNA fragment (T35525) corresponds to nucleotides -356 to
CC   +669 relative to the initiation codon of the human interferon-beta
CC   (IFN-beta) gene and encodes a 21-amino acid signal peptide and 120-
CC   amino acid mature protein.  It forms part of a DNA clone isolated
CC   from a human leukocyte genomic DNA library; the 5' untranslated
CC   region is given in T35524.  Non-coding genomic sequences within and
CC   upstream of the transcribed regions of the gene may be used as
CC   targeting sequences in DNA constructs useful for gene activation by
CC   homologous recombination.  Novel genes are generated in which
CC   exogenous and endogenous exons are operatively linked.  Expression
CC   of IFN-beta encoded by the endogenous gene can be activated in
CC   order to alleviate the symptoms of multiple sclerosis.

PT   Affecting enzymatic activity in plant by expressing anti-sense
PT   intron sequence - esp. for inhibiting starch branching enzyme thus
PT   creating modified starch without post-harvest derivatisation
PS   Claim 9; Page 37; 70pp; English.
CC   T79804 is the promoter region of the potato starch-branching enzyme
CC   (SBE) gene. This sequence is used in genetic constructs to control the
CC   expression of sequences antisense to introns of the SBE gene. Such
CC   constructs are used to produce transgenic plants producing modified
CC   or new forms of starch for industrial use. The sequences allow starches
CC   to be made without post-harvest modification (which uses hazardous
CC   chemicals and requires much energy). Using the antisense intron
CC   sequences is more reliable, efficient and selective than known methods
CC   for regulating enzymatic activity because there is almost no homology
CC   between introns in different SBE genes. The SBE gene promoter is also
CC   useful in other genetic engineering methods.

PT   Affecting enzymatic activity in plant by expressing sense intron
PT   sequence - esp. for inhibiting starch branching enzyme to create
PT   modified starch without post-harvest derivatisation
PS   Claim 9; Page 33; 70pp; English.
CC   T79783 is the promoter region of the potato starch-branching enzyme
```

```
CC   (SBE) gene. This sequence is used in genetic constructs to control the
CC   expression of sequences antisense to introns of the SBE gene. Such
CC   constructs are used to produce transgenic plants producing modified
CC   or new forms of starch for industrial use. The sequences allow starches
CC   to be made without post-harvest modification (which uses hazardous
CC   chemicals and requires much energy). Using the antisense intron
CC   sequences is more reliable, efficient and selective than known methods
CC   for regulating enzymatic activity because there is almost no homology
CC   between introns in different SBE genes. The SBE gene promoter is also
CC   useful in other genetic engineering methods.

PT   Nucleic acids associated with damaged or regenerating nerve cells -
PT   for diagnostic or therapeutic use.
PS   Claim 1; Page 37-39; 54pp; German.
CC   Nucleic acids described in T34587-T34616 are useful as probes for
CC   detecting traumatic and pathological changes in the peripheral
CC   nervous system.  They may also be used to identify hybridising
CC   sequences from an ischial nerve cDNA library, these sequences encode
CC   proteins expressed in damaged and/or regenerating nerve cells. They
CC   can be used to transfect cells which then express the protein which
CC   can then be harvested and studied.  The nucleic acids are preferably
CC   selected from NTII-11 which corresponds to plasmolipin cDNA with a
CC   234 bp N-terminal extension and is expressed in glial cells of the
CC   central nervous system and Schwann cells of the peripheral nervous
```

```
CC   system; NTII-1, which codes for a protein having 79% homology with
CC   human CDC4L in three domains and may be involved in regulating
CC   Schwann cell growth as well as being therapeutically useful for
CC   regenerating nerve cells; and CRII-7 which codes for a protein which
CC   is similar to the macrophage-specific cysteine-rich mouse protein
CC   MS2 and a metalloprotease  and which inhibits interaction between
CC   Schwann cells and the extracellular matrix and is useful for the
CC   therapy of nerve damage by facilitating regeneration of damaged
CC   axons.  This sequence is designated NTI-11.

PT   Affecting enzymatic activity in plant by expressing sense intron
PT   sequence - esp. for inhibiting starch branching enzyme to create
PT   modified starch without post-harvest derivatisation
PS   Disclosure; Page 38-42; 70pp; English.
CC   T79784 represents the full length potato starch-branching enzyme
CC   (SBE) gene. Sequences antisense to introns of the SBE gene are used
CC   to produce transgenic plants producing modified or new forms of starch
CC   for industrial use. The sequences allow starches to be made without
CC   post-harvest modification (which uses hazardous chemicals and requires
CC   much energy). Using the antisense intron sequences is more reliable,
CC   efficient and selective than known methods for regulating enzymatic
CC   activity because there is almost no homology between introns in
CC   different SBE genes. The SBE gene promoter (see T79783) is also
CC   useful in genetic engineering.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 1698; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Identifying gene signatures in 3'-directed human cDNA library - e.g.
PT   for diagnosis of abnormal cell function, by preparing cDNA that
PT   reflects relative abundance of corresp. mRNA in specific human
PT   tissues
PS   Claim 1; Page 774; 2245pp; Japanese.
CC   A single-stranded DNA (or its complementary strand or the corresp.
CC   double-stranded DNA) which comprises one of the 7837 "GS" sequences
CC   given in T19001-T26837 and which is able to hybridise to part of
CC   human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature)
CC   sequences were obtained from 3'-directed cDNA libraries prepared
CC   from various human tissues; synthesis of cDNA was initiated from the
CC   3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-
CC   untranslated sequence is unique to a particular mRNA species, almost
CC   all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library
CC   is constructed so as to reflect accurately the relative abundance of
CC   different mRNAs in the particular tissue from which it was derived.
CC   The appearance frequency of a given GS in a cDNA library can be
CC   determined (esp. using primers and probes derived from the GS
CC   sequences) as a means of diagnosing abnormal cell function or for
CC   recognising different cell types.

PT   Helicobacter pylori nucleic acid sequences and related
PT   polypeptide(s)  - useful for vaccines to treat or prevent H. pylori
PT   infection, and to detect Helicobacter
PS   Claim 9; Page -; 148lpp; English.
CC   This sequence encodes a H. pylori cytoplasmic protein.
CC   The protein may be used in a vaccine to prevent or treat H. pylori
CC   infection or to identify H. pylori polypeptide binding compounds,
CC   useful as potential H. pylori life cycle activators or inhibitors.
CC   The genomic sequence of H. pylori (ATCC 55679) was determined from
CC   overlapping contigs generated by mechanically shearing the bacterial
CC   DNA. The sequences were analysed for ORF of at least 180 nucleotides,
CC   and the predicted coding regions defined by computer evaluation. To
CC   identify likely H. pylori antigens for vaccine development, the amino
CC   acid sequences predicted from various ORF were analysed for significant
CC   homology to other known or exported membrane proteins. Having identified
CC   and determined the sequences of interest, particular regions can be
CC   isolated from H. pylori by PCR amplification for recombinant polypeptide
CC   production, e.g. in E. coli hosts.
CC   Note: This DNA sequence is not reproduced in the specification and
CC   has been derived from the related specification, WO9719098.

PT   Helicobacter pylori nucleic acid sequences and related proteins -
PT   used for diagnostics and therapeutics
PS   Claim 1; Page 115; 235pp; English.
CC   This sequence encodes an H. pylori cytoplasmic protein. This sequence
CC   showed homology to methyl-accepting chemotaxis protein.
CC   Helicobacter pylori has been strongly linked to chronic gastritis and
CC   duodenal ulcer disease.  The nucleic acid sequences of the invention
CC   are used to evaluate compounds, especially activators or inhibitors of
CC   bacterial life cycle, for the ability to bind an H. pylori nucleic acid
CC   sequence.  The nucleic acid sequences, and corresponding proteins, are
CC   also useful for generating vaccines for immunising subjects against H.
CC   pylori or for use in detecting the presence of Helicobacter species in
CC   a sample.  Antisense nucleic acid sequences of these sequences are
CC   used to inhibit expression of a gene from Helicobacter species.  H.
CC   pylori whole genomic DNA was isolated and nebulised to a median size of
CC   2000 bp.  Purified DNA fragments were blunt-ended and ligated to unique
CC   BstXI-linker adapters in 100-1000 fold molar excess.  These linkers are
CC   complementary to the BstXI-cut pMPX vectors, while the overhang is not
CC   self-complementary.  Therefore the linkers will not concatemerise nor
CC   will the cut vector re-ligate itself easily.  The linker-adapter inserts
CC   were ligated to each of the 20 pMPX vectors to construct a series of
CC   shotgun subclone libraries.  The purified DNA samples were then
CC   sequenced.
CC   Note: The ORF/protein reference number for this sequence was obtained
CC   from the related specification, WO9640893.

PT   Protein designated streptococcal inhibitor of complement mediated
PT   lysis - useful for detecting, and vaccinating against Streptococcus
PT   infection
PS   Claim 8; Page 39-40; 63pp; English.
CC   A DNA sequence (T66501) codes for a novel protein (W16476),
CC   designated SIC (streptococcal inhibitor of complement mediated
CC   lysis), that plays a role in Streptococcus pyogenes pathogenicity
CC   and virulence, and which inhibits haemolysis by interacting with
CC   clusterin and members of the cystatin protein super family such as
CC   histidine rich glycoprotein (HRG).  The sic gene is located approx.
CC   188 bp downstream of the protein H gene (sph) and approx. 2.1 kb
CC   upstream of the C5a peptidase gene in S. pyogenes AP1.  Variant
CC   sic partial genes (see also T66502-03) have also been obtd. from
CC   other S. pyogenes strains.  The isolated sic genes can be used to
CC   produce recombinant SIC proteins in host cells for use in vaccines,
CC   or to design probes used to determine the presence of virulent S.
CC   pyogenes in a sample.

PT   New isolated human ceramide glucosyl:transferase - useful for prodn.
PT   of glucosyl:ceramide, a precursor of glycosphingolipid biosynthesis
PS   Claim 7; Page 15; 18pp; English.
CC   The present sequence encodes a novel ceramide glucosyltransferase
CC   (GlcT-1), which has catalytic activity for glucose transfer from
CC   UDP-glucose to ceramide. The present sequence can be used to produce
CC   large amounts of ceramide glucosyltransferase which catalyses the first
CC   glycosylation step of glycosphingoceramide to produce glucosylceramide,
CC   a precursor to more than 300 glycosphingolipid biosyntheses. It can
CC   also be used as a probe in clinical tests and diagnosis of diseases
CC   based on ceramide glucosyltransferase.

PT   DNA construct contg. gene of interest controlled by cotton fibre
PT   transcriptional factor  - used to produce altered phenotype cotton
PT   fibre cells expressing genes affecting pigmentation
PS   Claim 27; Fig 7A-B; 95pp; English.
CC   The present DNA from cotton encodes a lipid transfer protein (Ltp). The
CC   Ltp promoter is active throughout fibre development. DNA constructs
CC   containing cotton fibre-specific transcriptional factor promoters are
CC   useful to produce cotton fibre cells with altered phenotype, especially
CC   altered colour. Genes involved in the production of melanin (e.g.
CC   tyrosinase gene and ORF438 encoded protein from Streptomyces
CC   antibioticus) and indigo (mono-oxygenase genes possibly in conjunction
CC   with a tryptophanase gene) are of interest. The promoters of the
CC   invention are reliable and permit expression of a protein selectively
CC   in cotton fibre to affect qualities such as fibre strength, length,
CC   colour and dyability as required. The construct and methods can also be
CC   used for the introduction of other advantageous genes into a cotton
CC   plant, e.g. a plant hormone. In particular, fibres from a plant producing
CC   coloured fibres may be used to produce yarns and/or fabrics that do not
CC   require dyeing.

PT   Human type I carnitine palmitoyl transferase (CPTI)-like protein
PT   gene  - used for expression and detection of CPTI-like protein for
PT   diagnosis of diseases related to CPTI expression
PS   Claim 2; Page 7-13; 13pp; Japanese.
CC   This DNA encodes human type I carnitine palmitoyl transferase (CPTI)-like
CC   protein (W14438). The gene can be used for the expression and the
CC   detection of human CPTI-like protein and thus can be used for the
CC   diagnosis of various diseases related to the protein. The CPTI-like
CC   protein and DNA sequences may also be used to screen agents that may be
CC   useful for the treatment of such diseases.

PT   Nucleotide sequences for tomato spotted wilt virus nucleo-capsid
```

```
PT   protein - used to confer resistance to Tospoviruses by
PT   transformation of susceptible plant genomes
PS   Claim 1; Page 27-29; 89pp; English.
CC   Viruses in the Tospovirus genus (of which the tomato spotted wilt
CC   virus is one), infect a wide variety of plant species. Tomato
CC   spotted wilt virus (TSWV) has a wide host range, infecting more than
CC   360 plant species of 50 families and causing large economic losses
CC   to vegetables and ornamental plants worldwide. By inserting the
CC   gene (or fragments) encoding the nucleocapsid of TSWV into
CC   susceptible plants, it is possible to render plants resistant to
CC   infection. This sequence is a cDNA copy of the complete S RNA
CC   genome of a brazilian isolate of TSWV designated TSWV-B. The
CC   nucleocapsid protein is encoded on the complementary strand. The
CC   gene sequence of the nucleocapsid protein and the protein itself are
CC   described in Q70891 and R56548 respectively.

PT   New IgG binding proteins H' lacking an albumin binding sequence -
PT   useful in purifica. of excess IgG from blood and to diagnose
PT   autoimmune diseases
PS   Disclosure; Fig 8; 37pp; English.
CC   The inventors claim a protein prod. by a strain of Gp.A Streptococci.
CC   The protein has the AA sequence of protein H but lacks at least some
CC   part of the C and D regions (responsible for binding albumin), esp.
CC   it lacks the whole of these regions and extends for AA1 to AA158.
```

```
CC   Compared with matural protein H, it is more specific and may be used
CC   as part of a kit for the binding, separation and identification of
CC   human IgG.  The same sequences appear in WO9119741.

COMMENT     On Mar 2, 1998 this sequence version replaced gi:2804324.
            Sequencing is completed to a minimum standard of double strand
```

```
            coverage with a minimum of 2 clones and 2 reads with no ambiguities
            or 2 chemistries with a minimum of 2 clones and 3 reads with no
            ambiguities. If the sequence quality does not meet this standard,
            it will be indicated in the annotation.

            The repeat regions shown were identified using RepeatMasker by
            Adrian Smit.

            Sequence similarities were identified using Powerblast by Jinghui
            Zhang.

            Exon/Intron boundaries of identified genes were chosen if there
            were canonical splice junctions that maintained sequence continuity
            across the splice junctions.

TITLE Direct Submission
JOURNAL Submitted (09-APR-1996) Schizosaccharomyces pombe chromosome I
sequencing project, Sanger Centre, Hinxton Hall, Hinxton, Cambridge
CB10 1RQ E-mail: barrell@sanger.ac.uk
COMMENT Notes:
Details of yeast sequencing at the Sanger Centre are available on
the World Wide Web.
(URL, http://www.sanger.ac.uk/yeast/home.html)
Protein coding regions (CDS) have been predicted with the help of
computer analysis using the Genefinder program in PomBase (an ACEDB
database) with additional predictions for the branch-acceptor sites
supplied by the program Sp3splice. CAUTION: It is possible that for
any individual CDS we may have underestimated or overestimated the
number of introns/exons or we may not have chosen the correct
splice donor/acceptor sites.
CDS are numbered using the following system eg SPAC5H10.01c. SP (S.
pombe), A (chromosome 1), c5H10 (cosmid name), .01 (first CDS), c
(complementary strand).
The more significant matches with motifs in the PROSITE database
are also included but some of these may be fortuitous.
The length in codons is given for each CDS.
IMPORTANT: This sequence MAY NOT be the entire insert of the
sequenced clone. It may be shorter because we only sequence
overlapping sections once, or longer, because we arrange for a
small overlap between neighbouring submissions.
Cosmid c1B9 at the 3' end by cosmid c8A4 embl entry SPAC8A4
accession no. Z66569.

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre,
            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
```

```
            For a graphical representation of this sequence and its analysis
            see:-
            http://webace.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=K01C8
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            IMPORTANT: This sequence is not the entire insert of clone K01C8.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
            neighbouring submissions.
            The true left end of clone K01C8 is at 15138 in
            sequence Z49966.
            The true right end of clone K01C8 is at 24725 in this sequence. The
            true right end of clone F35C11 is at 10525 in this sequence. The
            start of this sequence (1. .102) overlaps with the end of sequence
            Z49966.
            The end of this sequence (24626. .24725) overlaps with the start of
            sequence AL023831.

  TITLE     Direct Submission
  JOURNAL   Submitted (05-SEP-1997) Department of Genetics, Washington
            University, 4444 Forest Park Avenue, St. Louis, Missouri 63108, USA
COMMENT     Submitted by:
                  Genome Sequencing Center
                  Department of Genetics, Washington University,
                  St. Louis, MO  63110, USA, and
                  Sanger Centre, Hinxton Hall
                  Cambridge CB10 1RQ, England
                  e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk

            NOTICE:  This sequence may not be the entire insert of this clone.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we provide a small overlap between
            neighboring submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone

                        NEIGHBORING COSMID INFORMATION:

            The 5' cosmid is K06H6;3' cosmid is F48G7.  Actual start of this
            cosmid is at base position 1 of CELZK488

            NOTES:

            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

LOCUS       HS310H5     29718 bp    DNA             PRI       19-MAR-1997
DEFINITION  Human DNA sequence from cosmid 310H5 from a contig from the tip of
            the short arm of chromosome 16, spanning 2Mb of 16p13.3. Contains
            EST and CpG island.
ACCESSION   Z69705
NID         g1204102
KEYWORDS    16p13.3; CpG island.
SOURCE      human.
  ORGANISM  Homo sapiens
            Eukaryotae; mitochondrial eukaryotes; Metazoa; Chordata;
            Vertebrata; Eutheria; Primates; Catarrhini; Hominidae; Homo.

  JOURNAL   Submitted (22-FEB-1996) Sanger Centre, Hinxton, Cambridgeshire,
            CB10 1RQ, England. E-mail enquires: humquery@sanger.ac.uk
COMMENT     IMPORTANT:  This sequence is not the entire insert of clone 310H5.
            It may be shorter because we only sequence overlapping sections
            once, or longer because we arrange for a small overlap between
```

```
            neighbouring submissions.
            The true left end of clone 310H5 is at 1 in this sequence. The true
            left end of clone 314G4 is at 20182.
            310H5 is from a 280kb clone contig extending from the telomere of
            16p.
            Higgs D.R., Flint J. unpublished. MRC Molecular Haematology Unit,
            Institute of Molecular Medicine, Oxford.
            310H5 came from the Los Alamos, flow sorted human Chromosome 16
            library.

                        e-mail: rw@nematode.wustl.edu and jes@sanger.ac.uk
                        NEIGHBORING COSMID INFORMATION:
            The 5' end lies in a gap followed by the cosmid F53A12;3' cosmid is
            C26B2, 200 bp overlap.  Actual start of this cosmid is at base
            position 1 of CELC18F3; actual end is at 6916 of CELC26B2

            NOTES:
            Coding sequences below are predicted from computer analysis, using
            the program Genefinder(P. Green and L. Hillier, ms in preparation).

  TITLE     Direct Submission
  JOURNAL   Submitted (06-NOV-1996) Nematode Sequencing Project, Sanger Centre,
            Hinxton, Cambridge CB10 1RQ, England and Department of Genetics,
            Washington University, St. Louis, MO 63110, USA. E-mail:
            jes@sanger.ac.uk or rw@nematode.wustl.edu
COMMENT     Coding sequences below are predicted from computer analysis, using
            predictions from Genefinder (P. Green, U. Washington), and other
            available information.
            For a graphical representation of this sequence and its analysis
            see:-
            http://weface.sanger.ac.uk/cgi-
            bin/display?db=wormace&class=Sequence &object=R09A8
            Current sequence finishing criteria for the C. elegans genome
            sequencing consortium are that all bases are either sequenced
            unambiguously on both strands, or on a single strand with both a
            dye primer and dye terminator reaction, from distinct subclones.
            Exceptions are indicated by an explicit note.
            IMPORTANT:  This sequence is NOT necessarily the entire insert of
```

```
            the specified clone.  It may be shorter because we only sequence
            overlapping sections once, or longer because we arrange for a small
            overlap between neighbouring submissions.
            This sequence is the entire insert of clone R09A8. The true right
            end of clone T24D5 is at 957 in this sequence. The start of this
            sequence (1. .106) overlaps with the end of sequence Z68012.
            The end of this sequence (37042. .37145) overlaps with the start of
            sequence Z95309.

COMMENT     On Oct 31, 1997 this sequence version replaced gi:1934872.
            IMPORTANT: This sequence is the entire insert of clone 127B14.
            During sequence assembly data is compared from overlapping clones.
            Where differences are found these are annotated as variations
            together with a note of the overlapping clone name. Note that the
            variations annotated may not be found in the sequence submission
            corresponding to the overlapping clone as we submit sequences with
            only a small overlap as described above.
            This sequence was generated from part of bacterial clone contigs of
            human chromosome X, constructed by the Sanger Centre chromosome X
            mapping group. Further information can be found at
            http://www.sanger.ac.uk/HGP/ChrX/
            This sequence has been finished according to sequence map criteria
            as follows. An attempt is made to resolve all sequencing problems,
            such as compressions and repeats, but not necessarily within known
            annotated human repeat sequence elements (e.g. Alu). Where the
            sequence is ambiguous, there is an annotation using the 'unsure'
            feature key.
            The true left end of clone 127B14 is at 1 in this sequence. The
            true right end of clone 127B14 is at 126263.
            127B14 is from the library RPCI1 constructed at the Roswell Park
            Cancer Institute by the group of Pieter de Jong.
            For further details see http://bacpac.med.buffalo.edu/.

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 , send
            mailto:egreen@nhgri.nih.gov , or see http://genome.wustl.edu/gsc

            SOURCE INFORMATION:
            This clone was derived from human PAC library RPCI-4, prepared by
            Pieter de Jong and coworkers at Roswell Park Cancer Institute,
            using the method described by Ioannou et al., Nature Genetics
            6:84-9 (1994).  The library is from one male donor.  For further
            details, see http://bacpac.med.buffalo.edu/
            The clone is available from Genome Systems, Inc.
            (http://www.genomesystems.com).
            VECTOR:  pCYPAC2
```

```
            NEIGHBORING SEQUENCE INFORMATION:
            The clone sequenced to the left is DJ0651K02, 200 bp overlap. The
            actual start of this clone is at base position 118942 of DJ0651K02;
            actual end is at 127270 of DJ0631B17.

            This clone contains STS sWSS1729 (NID:g1113193).

            * This sequence is unfinished. It consists of 4 contigs for
            * which the order is not known; their order in this record is
            * arbitrary. In some cases, the exact lengths of the gaps
            * between the contigs are also unknown; these gaps are  presented
            * as runs of N as a convenience only. When sequencing is complete,
            * the sequence data presented in this record will be replaced
            *by a single finished sequence with the same accession number.
            *     1     1571: contig of 1571 bp in length
            *  1572     1589: gap of unknown length
            *  1590    17664: contig of 16075 bp in length
            *  17665   17682: gap of unknown length
            *  17683   61881: contig of 44199 bp in length
            *  61882   61899: gap of unknown length
            *  61900   147709: contig of 85810 bp in length.

            mailto:sapiens@watson.wustl.edu

            NOTICE:  This sequence may not represent the entire insert of this
            clone.  It may be shorter because we only sequence overlapping
            clone sections once, or longer because we provide a small overlap
            between neighboring data submissions.

            This sequence was finished as follows unless otherwise noted:
            all regions were double stranded or sequenced with an alternate
            chemistry; an attempt was made to resolve all sequencing problems,
            such as compressions and repeats; all regions were covered by
            sequence from more than one subclone; and the assembly was
            confirmed by restriction digest.

            MAPPING INFORMATION:
            The sequence of this clone was established as part of a mapping and
            sequencing collaboration between the NHGRI Chromosome 7 Mapping
            Project (Eric D. Green, Director), John D. McPherson in the
            Department of Genetics (Washington University), and the Washington
            University Genome Sequencing Center.  For additional information
```

```
            about the map position of this sequence, see
            http://www.nhgri.nih.gov/DIR/GTB/CHR7 or send
            mailto:egreen@nhgri.nih.gov

            SOURCE INFORMATION:
            Clone RG009H02 is from the first release of the human BAC library
            CITB-978SK-B.  The library contains cloned DNA from the male
            fibroblast cell line 978SK.  See:  Shizuya et al., Proc. Natl.
            Acad. Sci. USA 89:8794-7 (1992); U-J. Kim et al., Genomics 34:213-8
            (1996).  This clone is available from Research Genetics, Inc.
            (http://www.resgen.com).
            VECTOR:  pBeloBAC11
            Selection:  chloramphenicol

            NEIGHBORING SEQUENCE INFORMATION:
            The actual start of this clone is at base position 1 of RG009H02;
            actual end is at 149566 of RG009H02. The orientation of this clone
            is unknown.

            This clone contains STS sWSS1764 (NID:g1254731).

COMMENT     On Sep 30, 1998 this sequence version replaced gi:3646081.
            IMPORTANT: This sequence is unfinished and does not necessarily
            represent the correct sequence. Work on the sequence is in progress
            and the release of this data is based on the understanding that the
            sequence may change as work continues. The sequence may be
            contaminated with foreign sequence from E.coli, yeast, vector,
            phage etc. Order of segments is not known; 800 n's separate
            segments. Unfinished: dJ404K8  Contig_ID: 02519  acc=AL023883
            Length: 152115 bp.
